EXECUTIVE SUMMARY

On behalf of Gavin Power, LLC (Gavin), Environmental Resources Management, Inc. (ERM) has prepared this 2024 Annual Groundwater Monitoring and Corrective Action Report summarizing groundwater monitoring activities at the Residual Waste Landfill (RWL) and Fly Ash Reservoir (FAR) at the General James M. Gavin Power Plant (Plant) located in Cheshire, Ohio. The RWL and FAR are coal combustion residual (CCR) units at the Plant that are subject to regulation under Title 40, Code of Federal Regulations (CFR), Part 257, Subpart D (40 CFR § 257.50 et seq.), also known as the CCR Rule. In 2021, ERM certified an updated combined monitoring well network for the RWL and FAR, as allowed by 40 CFR 257.91 and as documented in the Updated Groundwater Monitoring System Evaluation and Certification—40 CFR 257.91 (ERM 2021a). Previously, Gavin maintained and monitored two separate (though adjacent) monitoring networks for the RWL and FAR.

This report documents the status of the groundwater monitoring program for the RWL and FAR, which includes the following as required by 40 CFR § 257.90(e):

- A description of the current program status.
- A summary of key actions completed.
- A description of problems encountered, and actions taken to resolve the problems.
- Identification of key activities for the coming year.

The combined RWL and FAR CCR unit groundwater monitoring program began calendar year 2024 in "detection monitoring" program status as defined by 40 CFR § 257.94 and remains in detection monitoring at the end of the 2024 reporting period. Groundwater monitoring in 2024 consisted of two semi-annual monitoring events completed in the spring and fall of 2024, which included groundwater potentiometric elevation measurements and subsequent groundwater sampling. Groundwater potentiometric elevation measurements were used to construct updated groundwater potentiometric surface maps for each of the geologic units monitored.

Groundwater samples were collected for laboratory analysis of CCR Rule Appendix III constituents, and the results were compared to previously calculated upgradient well prediction limits to identify statistically significant increases (SSIs) for downgradient wells. One downgradient monitoring well screened in the Cow Run Sandstone, 9631, exhibited SSIs for certain analytes in 2024. No wells screened in the alluvium or the Morgantown Sandstone exhibited SSIs:

	Sep/Oct-2024	ϕ	X	X	ϕ	ϕ	ϕ	X

Notes: ϕ = no SSI; X = SSI; SSI = statistically significant increase; NS = not sampled, TDS = total dissolved solids

[1] Well 2018-01 was abandoned in 2022. A replacement monitoring well is currently being evaluated.

[2] The SSI for TDS was detected only in the field duplicate and not in the normal sample. Despite the lack of an SSI in the normal sample, the SSI for total dissolved solids in the duplicate sample is addressed in the H1 2024 Alternate Source Demonstration Report.

Each identified SSI was evaluated in the corresponding attached Alternate Source Demonstration (ASD) Reports. The ASD reports identify regional background as the source of the SSIs for calcium, chloride, and total dissolved solids [TDS] from monitoring well 9631; therefore, the RWL/FAR groundwater monitoring system remained in detection monitoring at the conclusion of 2024. Accordingly, no remedial actions were selected, initiated, or performed in 2024.

Some of the topics discussed in this report are also addressed in USEPA's November 22, 2022 Final Decision: Denial of Alternative Closure Deadline for General James M. Gavin Plant, Cheshire, Ohio (Final Decision). In other documents, Gavin has explained how the approaches described and documented in this report are consistent with USEPA regulations and guidance as well as with best engineering practices and judgment. Gavin has contested USEPA's findings in the Final Decision from a factual, technical and legal perspective. ERM notes that USEPA's findings and determinations in the Final Decision are the subject of pending litigation.

1. INTRODUCTION

The General James M. Gavin Plant is located in southeast Ohio along the western bank of the Ohio River (Figure 1-1) near Cheshire, Ohio. The Plant contains three regulated CCR units that are subject to regulation under Title 40, Code of Federal Regulations, Part 257, Subpart D (40 CFR 257.50 et seq.), also known as the CCR Rule: the RWL, the FAR, and the Bottom Ash Pond. An updated combined groundwater monitoring system was certified in August 2021 to monitor for potential releases from the RWL and FAR. Previously, Gavin maintained and monitored two separate (though adjacent) groundwater monitoring networks for the RWL and FAR, respectively, but certified the combined monitoring network on 31 August 2021 with completion of the Updated Groundwater Monitoring System Evaluation and Certification—40 CFR 257.91 (ERM 2021a). The Bottom Ash Pond has a separate monitoring system (ERM 2021b) and is not addressed in this report.

This report was produced by ERM on behalf of Gavin Power, LLC and documents the status of the groundwater monitoring program for the RWL/FAR network, including the following as required by 40 CFR § 257.90(e):

- A description of the current program status.
- A summary of key actions completed.
- A description of problems encountered, and actions taken to resolve the problems.
- Identification of key activities for the coming year.

Consistent with the reporting and notification requirements of the CCR Rule, this annual groundwater monitoring report will be posted to the Plant operating record no later than 31 January 2025 (40 CFR § 257.105(h)(1)). Within 30 days of placing the report in the operating record, notification will be made to the Ohio Environmental Protection Agency and the report will be placed on the Plant's publicly accessible internet site (40 CFR §§ 257.106(h)(1), 257.107(h)(1)). Table 1-1 cross-references the reporting requirements under the CCR Rule with the contents of this report.

TABLE 1-1: REGULATORY REQUIREMENT CROSS-REFERENCE TABLE

Regulatory Citation in 40 CFR Part 257, Subpart D	Requirement (paraphrased)	Where Addressed in this Report
§ 257.90(e)(6)	Current status of the groundwater monitoring program.	Section 2
§ 257.90(e)	Summarize key actions completed.	Section 4
§ 257.90(e)	Describe any problems encountered and actions taken to resolve problems.	Section 4.2
§ 257.90(e)	Key activities for upcoming year.	Section 6.0
§ 257.90(e)(1)	Map, aerial image, or diagram of CCR unit and all background and downgradient monitoring wells.	Figure 3-2 and 3-3
§ 257.90(e)(2)	Identification of new monitoring wells installed or abandoned during the preceding year and narrative description.	Section 4.1
§ 257.90(e)(3)	Summary of groundwater data, wells sampled, date sampled, and whether sampling was required under detection or assessment monitoring.	Section 2, 3, 4 and Appendix C and D
§ 257.90(e)(4)	Narrative discussion of any transition between monitoring programs (i.e., from detection to assessment monitoring).	N/A
§ 257.93(c) (via § 257.90(e)(5))	Rate and direction of groundwater flow each time groundwater is sampled.	Section 5.1 and 5.2
§ 257.93(h)	Summary of SSIs over background values for each constituent listed in Appendix III of the CCR Rule.	Section 5.3
§ 257.94(e)(2) (via § 257.90(e)(5))	Any alternate source demonstration reports and related certifications pertaining to a detection monitoring program.	Appendices C and D
§ 257.95(g)(3) (via § 257.90(e)(5))	Any alternate source demonstration reports and related certifications pertaining to an assessment monitoring program.	N/A
§ 257.96(a) (via § 257.90(e)(5))	Any assessment of corrective measures to prevent further releases, remediate any releases, and restore affected area to original conditions, including the related certifications.	N/A
§ 257.97(a) (via § 257.90(e)(5))	Any semi-annual reports describing the progress in selecting and designing a remedy, including the related certifications.	N/A
§ 257.98(e) (via § 257.90(e)(5))	Any notification describing the completion of the selected remedy, including the related certifications.	N/A

2. PROGRAM STATUS § 257.90(E)

The combined RWL and FAR groundwater monitoring system began the 2024 reporting period in detection monitoring. SSIs were identified in one Cow Run Sandstone downgradient monitoring well in the RWL/FAR groundwater monitoring network for calcium, chloride, and TDS in 2024. Regional discharge of naturally occurring brine originating from bedrock was identified as the alternate source for the SSIs. Therefore, the RWL/FAR remains in detection monitoring at the end of the 2024 reporting period.

3. BACKGROUND

3.1 DESCRIPTION OF CCR UNITS

The RWL is approximately 400 acres in size and is located about 1.25 miles northwest of the Plant (Figure 3-1). The CCR material disposed in the RWL is Flue Gas Desulfurization byproduct (consisting of scrubber cake, fly ash, and lime) and other approved materials (water treatment sludge, bottom ash, lime ball mill rejects, coal pulverizer rejects, and sand/moss from the vertical flow wetlands).

The FAR is approximately 300 acres in size and is located about 2.5 miles northwest of the Plant (Figure 3-1). From the mid-1970s until January 1995, fly ash was sluiced to the FAR and the settled CCR materials in the FAR were retained behind the Stingy Run Fly Ash Dam that formed the FAR. The FAR was closed in place, and the closure was completed in 2021. Closure was certified on July 30, 2021.

3.2 GEOLOGY AND HYDROGEOLOGY

The shallowest geologic materials at the FAR/RWL include mine spoil, fill, residual fine-grained soils, and weathered and fractured bedrock (ERM 2021a). Measured hydraulic conductivities for residual fine-grained soils range from 1.03×10^{-8} centimeters per second (cm/sec) to 5.60×10^{-9} cm/sec (AEP, 1993). The shallowest weathered and fractured bedrock present at the Site includes the Pomeroy Sandstone and Coal, the Pittsburgh Sandstone and Coal, the Bellaire Sandstone, and the Connellsville Sandstone units. Although some of these units may be partially or fully saturated in the vicinity of the FAR and RWL, these formations generally are not capable of yielding usable quantities of groundwater, and thus are not considered part of the uppermost aquifer at the FAR/RWL. In the vicinity of the Site, bedrock dips to the southeast at approximately 17 feet/mile (AEP 1993).

The Connellsville Sandstone is still present in portions of the ridges that surround the FAR valley and the RWL. However, the Connellsville Sandstone has been completely eroded in substantial portions of the valley areas of the FAR, especially at the eastern extent of the FAR nearest the current extent of Stingy Run. The Connellsville Sandstone has also been partially or completely eroded in portions of the valley areas underlying the RWL.

Beneath the Connellsville Sandstone are the Clarksburg Red Beds, which is a regionally extensive aquitard (low-permeability rock layer) with a typical thickness of approximately 40 to 50 feet and average hydraulic conductivity values for the formation ranging from 2.1×10^{-7} cm/sec to 7.8×10^{-8} cm/sec (Geosyntec, 2012). The Clarksburg Red Beds hydraulically isolate the shallower bedrock formations from the underlying aquifers. The Clarksburg Red Beds have been observed to be partially or entirely eroded in portions of the valley areas of the FAR and RWL, especially in the eastern extent of the FAR valley areas. However, residual fine-grained soils generated in-situ by the weathering process are generally present in areas where erosion of the Clarksburg Red Beds has occurred. Based upon measured hydraulic conductivity values for the residual fine-grained soils (1.03×10^{-8} cm/sec to 5.60×10^{-9} cm/sec), these soils provide hydraulic separation similar to that provided by the Clarksburg Red Beds. Beneath the Clarksburg Red Beds are the Morgantown

Sandstone and the Cow Run Sandstone. Together these units are interpreted as the uppermost aquifer beneath the RWL and FAR (Geosyntec 2016a; Geosyntec 2016b).

The Morgantown Sandstone is composed of two thin sandstone beds (upper and lower), which are separated by clay shale. The Morgantown Sandstone unit has a total average thickness of approximately 30 feet, and the upper and lower sandstone beds generally range in thickness from approximately three to seven feet. It has been documented through review of historical boring logs that the Morgantown Sandstone has been removed by erosion and is absent in portions of the Stingy Run and Kyger Creek valley areas. The Morgantown was also confirmed to be absent at recent boring 2022-06, which was advanced in 2022 in the Stingy Run valley at the northeastern end of the RWL (ERM 2024). Groundwater migrating east-southeast within the Morgantown Sandstone along the eastern portion of the RWL discharges to the alluvial aquifer located within the Stingy Creek and Kyger Creek valleys. Thus, the alluvial aquifer is also considered part of the uppermost aquifer where the Morgantown Sandstone is absent in these areas.

Below the Morgantown Sandstone is a unit of approximately 60 feet of interbedded claystone/clay shale and non-crystalline limestone layers, collectively known as the Round Knob Shale. These strata extend to the top of the underlying Cow Run Sandstone. Together, the residual fine-grained soils, the Clarksburg Red Beds, and the Round Knob Shale unit provide hydraulic separation from the aquifers underlying the RWL. Though the Clarksburg Red Beds have been partially or entirely eroded in portions of the FAR valley areas, the residual fine-grained soils and deeper Round Knob Shale unit provide hydraulic separation from the aquifers underlying the FAR similar to that provided by the collective lithologic units underlying the RWL.

Below the Round Knob Shale, the Cow Run Sandstone has an average thickness of 30 feet and is characterized regionally as a coarse-grained sandstone and sandy shale. The Cow Run Sandstone unit is continuous under the FAR/RWL and considered the base of the uppermost aquifer. Beneath the Cow Run Sandstone are the Portersville Limestone and the Anderson Clayshale which consist primarily of shale, claystone, and clay shale (Geosyntec 2012). These low permeability formations are interpreted to be the lower hydraulic boundary of the uppermost aquifer.

3.2.1 GROUNDWATER FLOW

The removal of strip mine ponds, installation of groundwater intercept (GWI) drains, and placement of the composite liner under the RWL resulted in decreased recharge to the Morgantown Sandstone and Cow Run Sandstone. The changes during and post-construction were interpreted to result in the decline of potentiometric elevations up to 10 feet, which is similar to observed declines at another AEP residual waste landfill (AEP 1993).

At a regional scale, groundwater within the Morgantown Sandstone and Cow Run Sandstone generally flows from the northwest to the southeast under the FAR and the RWL toward the Ohio River, which is the primary regional discharge boundary for groundwater. At Site-scale, several factors influence groundwater flow directions in the area of the FAR/RWL, including topographic ridges and suppression of infiltration related to the FAR cap and the liner system of the RWL. Ridges along the western, eastern, and southern perimeters of the RWL constitute areas of recharge. Due to removal of strip mine ponds, installation of GWI drains, and placement of the

composite liner, recharge to the center of the RWL has been cut off (AEP, 1993). Recent potentiometric surface maps, including those prepared for this report (See Section 5.1), incorporate not only the information from existing monitoring wells but also consider additional relevant data including original land surface topography, current land surface topography, landfill expansion, remaining recharge areas outside of the landfill expansion, and any effect of the GWIs.

3.2.1.1 GROUNDWATER FLOW ALONG THE WESTERN BOUNDARY OF THE RWL/FAR

To the west of the FAR/RWL, groundwater flows from west to east before joining the overall flow pattern to the southeast. The interpretation of west to east groundwater flow at the western boundary of the RWL is based on specific past and current observations along the western boundary. Groundwater flow maps prepared for the 1993 RWL Permit to Install (AEP, 1993; Figure No. 21) and the 1999 reissued Potentiometric Map of the RWL (AEP Drawing No. 3J of Drawing 12-30729-5) both interpreted groundwater flow from west to east in the Morgantown from a recharge area near wells 94131 toward the historical valley near Pond 1. The potentiometric contours in AEP Figure No. 21 and AEP Drawing No. 3J of Drawing 12-30729-5 also indicate a recharge area farther north, near wells 93102 and 94125, with components of groundwater flow to the southeast and east along the northwestern RWL boundary.

The 1960 USGS topographic map shows a topographic ridge existed east of Turkey Run Road, in the area that would become the western boundary of the RWL (USGS, 1960) The correlation of the potentiometric highs on the 1993 and 1999 figures referenced above and topographic highs suggests the area east of Turkey Run Road was a recharge area prior to the construction of the RWL. The USGS quadrangle notes the presence of historical mines in this area, which is interpreted to enhance recharge along ridges due to mine collapse and the presence of near-vertical fractures. While there has been some modification of the land surface in recent years associated with the westward expansion of the RWL, the current land surface topography still consists of a ridge between the RWL and Turkey Run Road.

The RWL is located on the eastern side of this surface and groundwater ridge, so groundwater flow is interpreted to be from west to east at the western edge of the RWL, consistent with gravity-driven groundwater flow from areas of higher topographic relief to areas of lower topographic relief (Toth, 2009). This west to east flow pattern indicated in the 1993 interpretation is expected to be enhanced due to the reduction in recharge caused by removal of strip mine ponds that had acted as local recharge points within and near the RWL, installation of GWI drains which currently facilitate the movement of shallow groundwater to areas outside the RWL, and installation of the RWL liner which by design inhibits the downward migration of water (AEP, 1993).

Groundwater flow maps provided in the 2018 through 2023 Annual Groundwater Monitoring and Corrective Action Reports consistently show an easterly flow component in the Morgantown and Cow Run (ERM, 2019; ERM, 2020; ERM, 2021c; ERM, 2022; ERM, 2023; ERM, 2024). Justification for this interpretation based on potentiometric elevation data includes the following:

- The potentiometric surface at Morgantown well 2019-02 was higher than nearby Morgantown wells 2019-06 and 9535 in five out of six gauging events conducted between

2020 and 2022. The physical configuration of the wells and the measured piezometric elevations indicate an eastward groundwater flow direction in the Morgantown on the western side of the RWL.

- The potentiometric surface at Cow Run monitoring well 94126 was higher than nearby well 93100 in five out of six gauging events conducted between 2018 and 2019. The physical configuration of the wells and the measured piezometric elevations indicate an eastward groundwater flow direction in the Cow Run on the western side of the RWL.
- A comparison of potentiometric elevation data at wells 94125 and 2019-06 also supports the eastward flow interpretation. Well 94125 was abandoned in 2019 due to RWL expansion and replaced in 2020 by 2019-06, which was located 450 feet to the west, outside the new boundary of waste. The average potentiometric elevation at 94125 from 2013 to 2019 was 589.47 feet above sea level and the average elevation at 2019-06 from 2020 to 2023 is 601.79 feet above sea level. The 12.32-foot difference in average elevation over several years generally supports the interpretation of groundwater flow from west to east.

3.2.1.2 GROUNDWATER FLOW ALONG THE EASTERN BOUNDARY OF THE RWL/FAR

The interpretation of groundwater divides east of the RWL eastern waste boundary and within remnant highwalls (*e.g.*, near wells 94122, MW-15, and MW-16) is based on specific past and current observations along the eastern boundary, similar to those used to assess the groundwater divide along the western boundary of the RWL. The groundwater flow map prepared for the 1993 RWL PTI (AEP, 1993; Figure No. 21) interpreted radial groundwater flow in the Morgantown on the eastern side of the RWL from a recharge area near historic well 94122 and existing well 2001. This radial flow pattern is indicative of a recharge area and existed prior to the construction of the RWL.

The 1960 USGS topographic map shows a topographic ridge existed on the eastern boundary of the RWL at historic well 94122 and existing well 2000 (USGS, 1960). A ridge also ran northwest near the former FAR overflow spillway towards wells 2022-04 and 2022-05. Potentiometric highs were documented both on the eastern side of the future RWL near where the Stacker Pad currently exists, and north of where Pond 1 currently exists (AEP, 1993; Drawing No. 3J of Drawing 12-30729-5). The correlation of the potentiometric highs and topographic highs suggests that these areas were recharge areas prior to the construction of the RWL. The USGS quadrangle notes the presence of historical strip mines in this area, which may have enhanced recharge along ridges due to mine collapse and the presence of near-vertical fractures. While there has been some modification of the land surface in recent years associated with the expansion of the RWL, the current land surface topography still consists of a ridge along the eastern and northeastern sides of the RWL.

The groundwater divide prevents groundwater under the RWL from flowing towards the east in this area. West of the hydraulic divide located on the eastern side of the RWL, groundwater flow is interpreted to be from east to west before turning and flowing to the southeast. This east-to-west flow pattern was and is expected to be enhanced from 1993 interpretations due to the removal of

strip mine ponds, installation of GWI drains, and placement of the composite liner that cut off recharge to the aquifer beneath the RWL (AEP, 1993).

3.2.1.3 REFINEMENT IN INTERPRETATION OF GROUNDWATER FLOW BENEATH THE RWL/FAR

In 2018, federal and state groundwater potentiometric elevation data sets for monitoring wells of the Morgantown and Cow Run were combined to increase spatial resolution and limit uncertainty in the interpretation of groundwater flow direction. This assessment identified: (i) the area of low hydraulic pressure along the axis of the landfill; (ii) groundwater flow from west to east on the western boundary; and (iii) a potentiometric high on the northeastern boundary of the RWL. The updated interpretation of regional groundwater flow in the Morgantown and Cow Run was from northwest to southeast towards the Ohio River. The overall interpretation of groundwater flow in the vicinity of the RWL/FAR is strongly influenced by site geology, pre-construction topography, and site preparation as hydraulic information is no longer able to be obtained from within the RWL due to the liner system or from within the FAR due to the cap.

Generally, the interpretations of groundwater flow under the RWL have been relatively consistent with overall flow towards the southeast. However, recent maps use higher-resolution datasets and differ in some ways from the flow directions and hydraulic features indicated in the 2012 PTI, such as the aforementioned ridge (Geosyntec, 2012). As shown in the 2018 through 2023 Annual GWMCA Reports, existing wells located along the eastern and northeastern boundary include couplet wells 2002 and 2003, and 2022-04 and 2022-05, located in the Morgantown and Cow Run, respectively. At these locations, the Morgantown has a higher potentiometric surface than the Cow Run. These downward gradients demonstrate the presence of recharge areas. Groundwater flow direction maps prepared for the 2018-2023 Annual GWMCA Reports consistently show groundwater mounds and radial flow in the Morgantown in this area.

3.2.2 HYDRAULIC CONDUCTIVITY

Packer tests were completed in 2012 to assess hydraulic conductivity for locations in both the Morgantown and Cow Run Sandstone around the northern portion of the RWL (AEP and Geosyntec 2012). The range of hydraulic conductivity values from the packer tests in the Morgantown and Cow Run are provided in Table 3-1.

TABLE 3-1: ESTIMATED HYDRAULIC CONDUCTIVITY VALUES FOR MORGANTOWN AND COW RUN SANDSTONE

	Average K	**Low K**	**High K**
Morgantown (Geosyntec 2012)	7.18 x 10^{-5} cm/sec	2.2 x 10^{-8} cm/sec	4.6 x 10^{-4} cm/sec
Cow Run (Geosyntec 2012)	2.92 x 10^{-5} cm/sec	5.0 x 10^{-8} cm/sec	5.9 x 10^{-4} cm/sec

Notes: cm/sec = centimeters per second; K = hydraulic conductivity
Geosyntec 2012 values derived from packer tests (10-foot interval) completed in boreholes across mainly the northern part of the RWL.

3.3 MONITORING WELL NETWORK

The RWL and FAR had previously been monitored using separate groundwater monitoring networks as described in the documents: Groundwater Monitoring Network Evaluation—Residual Waste Landfill (Geosyntec 2016a) and the Groundwater Monitoring Network Evaluation—Fly Ash Reservoir (Geosyntec 2016b). Annual Groundwater Monitoring and Corrective Action Reports for 2020 under these separate monitoring systems were prepared for the RWL (ERM 2021c) and FAR (ERM 2021d) and were posted to the Plant operating record on 31 January 2021. Because of the ongoing expansion of the RWL, several monitoring wells along the northern and western RWL boundaries were removed and a portion of the RWL was expanded over the FAR. To account for these changes and provide an adequate groundwater monitoring system for both units, a combined network for the two CCR units was identified and certified in August 2021 (ERM 2021a).

The combined certified network which monitors both the RWL (Figures 3-2) and FAR (Figure 3-3) contains 24 upgradient and 15 downgradient monitoring wells located in the Alluvium, Morgantown Sandstone, and Cow Run Sandstone. The upgradient wells are placed to accurately represent the quality of background groundwater that has not been affected by any potential leakage from the RWL and FAR units, while the downgradient wells in the network are positioned at the downgradient boundary of waste to detect a potential release of CCR constituents from the CCR units into groundwater in the uppermost aquifer. There are additional monitoring wells that are gauged and/or sampled, as required, to provide supplemental information to assist in the interpretation of data received from the certified monitoring network. These wells typically are not located at the downgradient limit of waste or do not reliably yield sufficient water for sampling and are not part of the certified groundwater monitoring network.

In 2022, 14 monitoring wells were installed around the RWL and FAR. Six of these wells were intended to act as replacements for monitoring wells that are included in the certified monitoring network, while the remaining eight were intended as additional groundwater monitoring locations. These wells are currently being sampled and evaluated for addition to the certified monitoring network as background or compliance wells. Monitoring wells installed in 2022 are depicted in Figures 3-2 and 3-3.

Well construction information for the monitoring wells in the certified network and replacement monitoring wells installed in 2022 is presented in Appendix A and boring logs and construction logs are provided in Appendix B.

3.4 PREVIOUS GROUNDWATER MONITORING ACTIVITIES

The RWL and FAR groundwater monitoring wells were initially sampled eight times between August 2016 and July 2017 to establish upgradient well baseline data. Prediction limits were developed using the baseline data and compared to the July 2017 downgradient well results, consistent with the CCR Rule and the Statistical Analysis Plan developed for Gavin (ERM 2017). This comparison resulted in the identification of SSIs for Appendix III analytes in downgradient RWL and FAR wells, which were reported in the 2017 Annual Groundwater Monitoring and Corrective Action Reports for the RWL and FAR (ERM 2018a and ERM 2018b). Based on a detailed review of groundwater elevations and resulting groundwater flow using the certified well network

and additional wells that are used for informational purposes only, the hydraulic positions of monitoring wells within the RWL and FAR networks were reevaluated to consider newly obtained information on hydraulic conditions, including groundwater elevations. A limited number of wells were reclassified as either upgradient or downgradient, and tolerance limits were updated based on the newly defined upgradient dataset. That hydraulic analysis and the derivation of the updated tolerance limits are presented in the first ASD reports for the FAR and RWL (ERM 2018c and ERM 2018d). Such ongoing assessment of groundwater flow is a normal part of developing and refining a conceptual site model as new information is collected, especially at a site with multiple aquifers, variable topography, and a history of underground activities. Subsequent sampling and comparison to background values were completed in 2018, 2019, 2020, 2021, 2022, and 2023.

Following the certification of the combined network, in December 2021, an addendum to the 2020 Annual Groundwater Monitoring and Corrective Action Reports for the FAR and RWL was prepared that evaluated the 2020 data based on the combined groundwater monitoring network (ERM 2021e). While this addendum was not required, it was prepared proactively to identify if the changes to the program resulted in any retroactive SSIs for 2020. Only one SSI was identified when evaluating the data collected in 2020 from the combined monitoring network: boron at monitoring well 2018-01 in March 2020. Although technically not applicable to 2020 (because the combined network was not certified until August 2021), ERM nevertheless prepared an ASD for the boron SSI to determine whether that finding would have changed the monitoring status of either CCR unit. The ASD identified regional brine as the source of boron and identified the use of cement-bentonite grout for well installation as the catalyst for the localized mobilization of previously adsorbed boron. Thus, even if the combined monitoring well network had been in effect in 2020, the RWL and FAR would have remained in detection monitoring at the conclusion of 2020.

4. MONITORING ACTIVITIES

4.1 MONITORING WELL ABANDONMENT

In order to maintain the quality of the wells included in the certified groundwater monitoring network, monitoring wells 2016-03 and 2016-04 were abandoned in 2024, with field activities occurring from February 27, 2024 through March 8, 2024. Downhole camera inspection of the wells and packer testing of well 2016-04 indicated that the wells' integrity was likely compromised. Both wells were decommissioned via the sealing-in-place method. Installation of replacement wells is planned for Q1 2025.

4.2 2024 SAMPLING SUMMARY

Groundwater samples were collected in 2024 as part of the detection monitoring program under 40 CFR § 257.94 and analyzed for the constituents listed in Appendix III to 40 CFR Part 257, Subpart D. Table 4-1 provides a summary of the 2024 first half of year (H1) and second half of year (H2) sample dates and the well gradient designation (upgradient or downgradient) relative to the CCR units. Appendix E provides an analytical summary of samples collected since 2016. Samples were collected by bladder pump, submersible pump, Snap sampler, or Geomon pump. In addition, the samples were not filtered in the field or at the laboratory per the requirement of 40 CFR § 257.93(i) and were managed under chain-of-custody procedures from the field to the laboratory.

Some monitoring wells could not be sampled in 2024 due to insufficient recharge/water, and only one monitoring well (2016-10) could not be sampled in H1 2024 due to pump failure. These pump issues were resolved and this well was sampled during the H2 2024 event. One well which was not sampled in 2023 due to pump failure (9631) had a replacement pump installed in December 2023 and was sampled in 2024. In many cases, poor recharge and significant depth to groundwater resulted in short water columns that made it challenging to produce enough groundwater to collect sufficient sample volume. In these cases, Gavin is investigating the potential for using passive sampling methods (e.g. dual-membrane passive diffusion bags).

TABLE 4-1: 2024 SAMPLING DATES FOR RWL/FAR COMBINED NETWORK

Monitoring Well	Geologic Unit	Location	Sampling Dates	
			H1	H2
2000	Morgantown	Downgradient	March 14, 2024	September 25, 2024
2003	Morgantown	Upgradient	March 13, 2024	September 19, 2024
9396	Cow Run	Upgradient	Abandoned/Replaced (2022-19)	
9631	Cow Run	Downgradient	March 13, 2024	September 20, 2024
9801	Cow Run	Upgradient	March 14, 2024	September 11, 2024

2019-06	Morgantown	Upgradient	NS[1]	NS[1]
2019-07	Cow Run	Upgradient	March 11, 2024	September 18, 2024
2019-09	Cow Run	Upgradient	March 12, 2024	September 17, 2024
MW-16	Morgantown	Upgradient	NS[1]	NS[1]
MW-17	Cow Run	Upgradient	March 12, 2024	September 19, 2024
MW-20	Cow Run	Upgradient	March 8, 2024	September 30, 2024

Notes: H1 = spring; H2 = fall; NS = Not Sampled
[1] Not sampled due to insufficient volume of water to allow collection of samples.
[2] Not sampled due to pump failure.
The monitoring wells installed in 2022 have been under observation to determine if water levels have reached equilibrium with their respective aquifers. In 2024, samples were collected from locations with sufficient water columns for low-flow sampling. At locations with short water columns, Gavin is investigating the potential for using passive sampling methods.

In addition to the semiannual groundwater monitoring events at the Site required under 40 CFR § 257.94, supplemental samples were collected at wells in the combined monitoring network under 40 CFR § 257.94(b). Samples were collected on a monthly or bi-monthly basis throughout 2024 from existing wells that were recently added to the network (9631, 9910, 2018-03, 2019-06) towards the required minimum of eight independent samples for each background well for the constituents listed in Appendices III and IV.

4.3 DATA QUALITY REVIEW

ERM reviewed field and laboratory documentation to assess the validity, reliability, and usability of the analytical results. Samples collected in 2024 were analyzed by the Eurofins Canton/Cleveland

laboratory, located in Barberton, Ohio. Data quality information reviewed for these results included field sampling forms, chain-of-custody documentation, holding times, laboratory methods, cooler temperatures, laboratory method blanks, laboratory control sample recoveries, field duplicate samples, matrix spikes/matrix spike duplicates, and equipment blanks. Data qualifiers were appended to results in the project database, as appropriate, based on laboratory quality measurements (e.g., control sample recoveries) and field quality measurements (e.g., agreement between normal and field duplicate samples). ERM's data quality review found the laboratory analytical results to be valid, reliable, and usable for decision making purposes with the listed qualifiers. No analytical results were rejected.

5. MONITORING RESULTS

5.1 GROUNDWATER POTENTIOMETRIC CONTOURS AND FLOW DIRECTION

Depth to groundwater measurements were collected in March and August 2024 at each monitoring well prior to each sampling event. Resulting potentiometric elevations were calculated by subtracting the depth to groundwater from the surveyed reference elevation for each well. Potentiometric elevations, interpreted potentiometric surface maps, and interpreted groundwater flow directions for wells screened in the Morgantown Sandstone (and alluvium) and Cow Run Sandstone are presented on Figures 5-1 and 5-2 (2024 H1) and Figures 5-3 and 5-4 (2024 H2), respectively.

The principal direction of groundwater flow in the uppermost aquifer system under the RWL and FAR (both in the Morgantown Sandstone and in Cow Run Sandstone) is from the north and northwest to the south and southeast, towards the Ohio River which is the local discharge boundary. Groundwater velocity estimates are presented in the next sections.

5.2 GROUNDWATER VELOCITY CALCULATION

5.2.1 MORGANTOWN SANDSTONE GROUNDWATER VELOCITY

Horizontal hydraulic gradients were calculated for the Morgantown Sandstone using groundwater elevations calculated at wells 96154R and 2018-02 for both the spring and fall sampling events. The velocity of groundwater through the Morgantown sandstone is estimated based on the measured horizontal hydraulic gradient, estimated hydraulic conductivity of 7.18×10^{-5} centimeters per second (Geosyntec 2012), and an estimated effective porosity value of 0.01 for fractured bedrock. For both the spring and fall sampling events, a horizontal hydraulic gradient of 0.010 was calculated, resulting in an estimated average groundwater velocity of 77 to 79 feet/year. Groundwater velocities in 2024 were similar to those calculated in 2023 (77 to 78 feet/year).

5.2.2 COW RUN SANDSTONE GROUNDWATER VELOCITY

Horizontal hydraulic gradients were calculated for the Cow Run Sandstone using groundwater elevations calculated at wells 96149 and 94136 for both the spring and fall sampling events. The velocity of groundwater through the Cow Run sandstone is estimated based on the measured horizontal hydraulic gradient, the estimated hydraulic conductivity of 2.92×10^{-5} centimeters per second (Geosyntec 2012), and an effective porosity value of 0.01 for fractured bedrock. Horizontal hydraulic gradients of 0.010 were calculated for both the spring and fall 2024 sampling events, resulting in an estimated average groundwater velocity of 31 to 32 feet/year. Groundwater velocities in 2024 were similar to those calculated in 2023 (31 feet/year).

5.3 COMPARISON OF RESULTS TO PREDICTION LIMITS

Consistent with the CCR Rule and with Gavin's Statistical Analysis Plan (ERM 2017), an interwell prediction limit approach was used to identify potential impacts to groundwater. Upper prediction limits were developed for the Appendix III parameters; in the case of pH, a lower prediction limit

was also developed. Documentation of the development of the upper prediction limits and lower prediction limit is provided in the 2018 Alternate Source Demonstration (ERM 2018c).

5.3.1 2024 SAMPLING EVENT RESULTS

Table 5-1 identifies no SSIs in the Morgantown/Alluvium downgradient wells and Table 5-2 identifies SSIs in one Cow Run downgradient well for the March (H1) and September/October (H2) 2024 monitoring events based on a comparison of the sampling results in downgradient wells to the prediction limits for the respective Appendix III analytes.

Monitoring well 2018-01 was abandoned in Fall 2022.

March 2024 SSIs were attributed to alternate sources, which were documented in the *Gavin RWL and FAR First Semiannual Sampling Event of 2024 ASD Report* which is included as Appendix C. The 2024 H1 ASD report identified regional discharge of naturally occurring brine originating from bedrock as the alternate source.

October/November 2024 SSIs were attributed to alternate sources, which were documented in the *Gavin RWL and FAR Second Semiannual Sampling Event of 2024 ASD Report*, which is included as Appendix D. The 2024 H2 ASD report identified regional discharge of naturally occurring brine originating from bedrock as the alternate source.

A summary of analytical results obtained from the RWL/FAR groundwater monitoring is provided in Appendix E. Laboratory analytical reports from both the spring and the fall sampling events as well as the supplemental sampling events are provided in Appendix F.

6. KEY FUTURE ACTIVITIES

The following key future activities are planned for 2025:

Groundwater Sampling

- Two groundwater sampling events will be performed in 2025 as part of the detection monitoring program at the RWL/FAR and the results will be compared to the prediction limits.
- Monitoring wells that were installed in 2022 will continue to be sampled and evaluated for addition to the certified monitoring network for use as background or compliance wells.
- Dedicated groundwater sampling pumps will continue to be inspected and repaired, or replaced, as necessary.
- Pilot testing of passive sampling methods will continue at locations where sample collection has been challenging due to low recharge resulting in low sample volume.

Groundwater Hydraulic Monitoring

- Monitoring wells installed in 2022 will continue to be gauged along with existing monitoring wells to establish relative hydraulic positions and evaluate areas of interest (e.g., the hydraulic ridges around the RWL).
- Transducers have been installed in six monitoring wells around the RWL/FAR. In 2025, transducer data will be downloaded, and the data processed and evaluated to support updates to the Conceptual Site Model.

Monitoring Network

- Replacements for monitoring wells 2016-03 and 2016-04 will be installed in Q1 2025.
- The existing monitoring network will be evaluated for potential additional wells.
- The background dataset will be evaluated and updated, if appropriate, to include all valid background data.

NOTES:

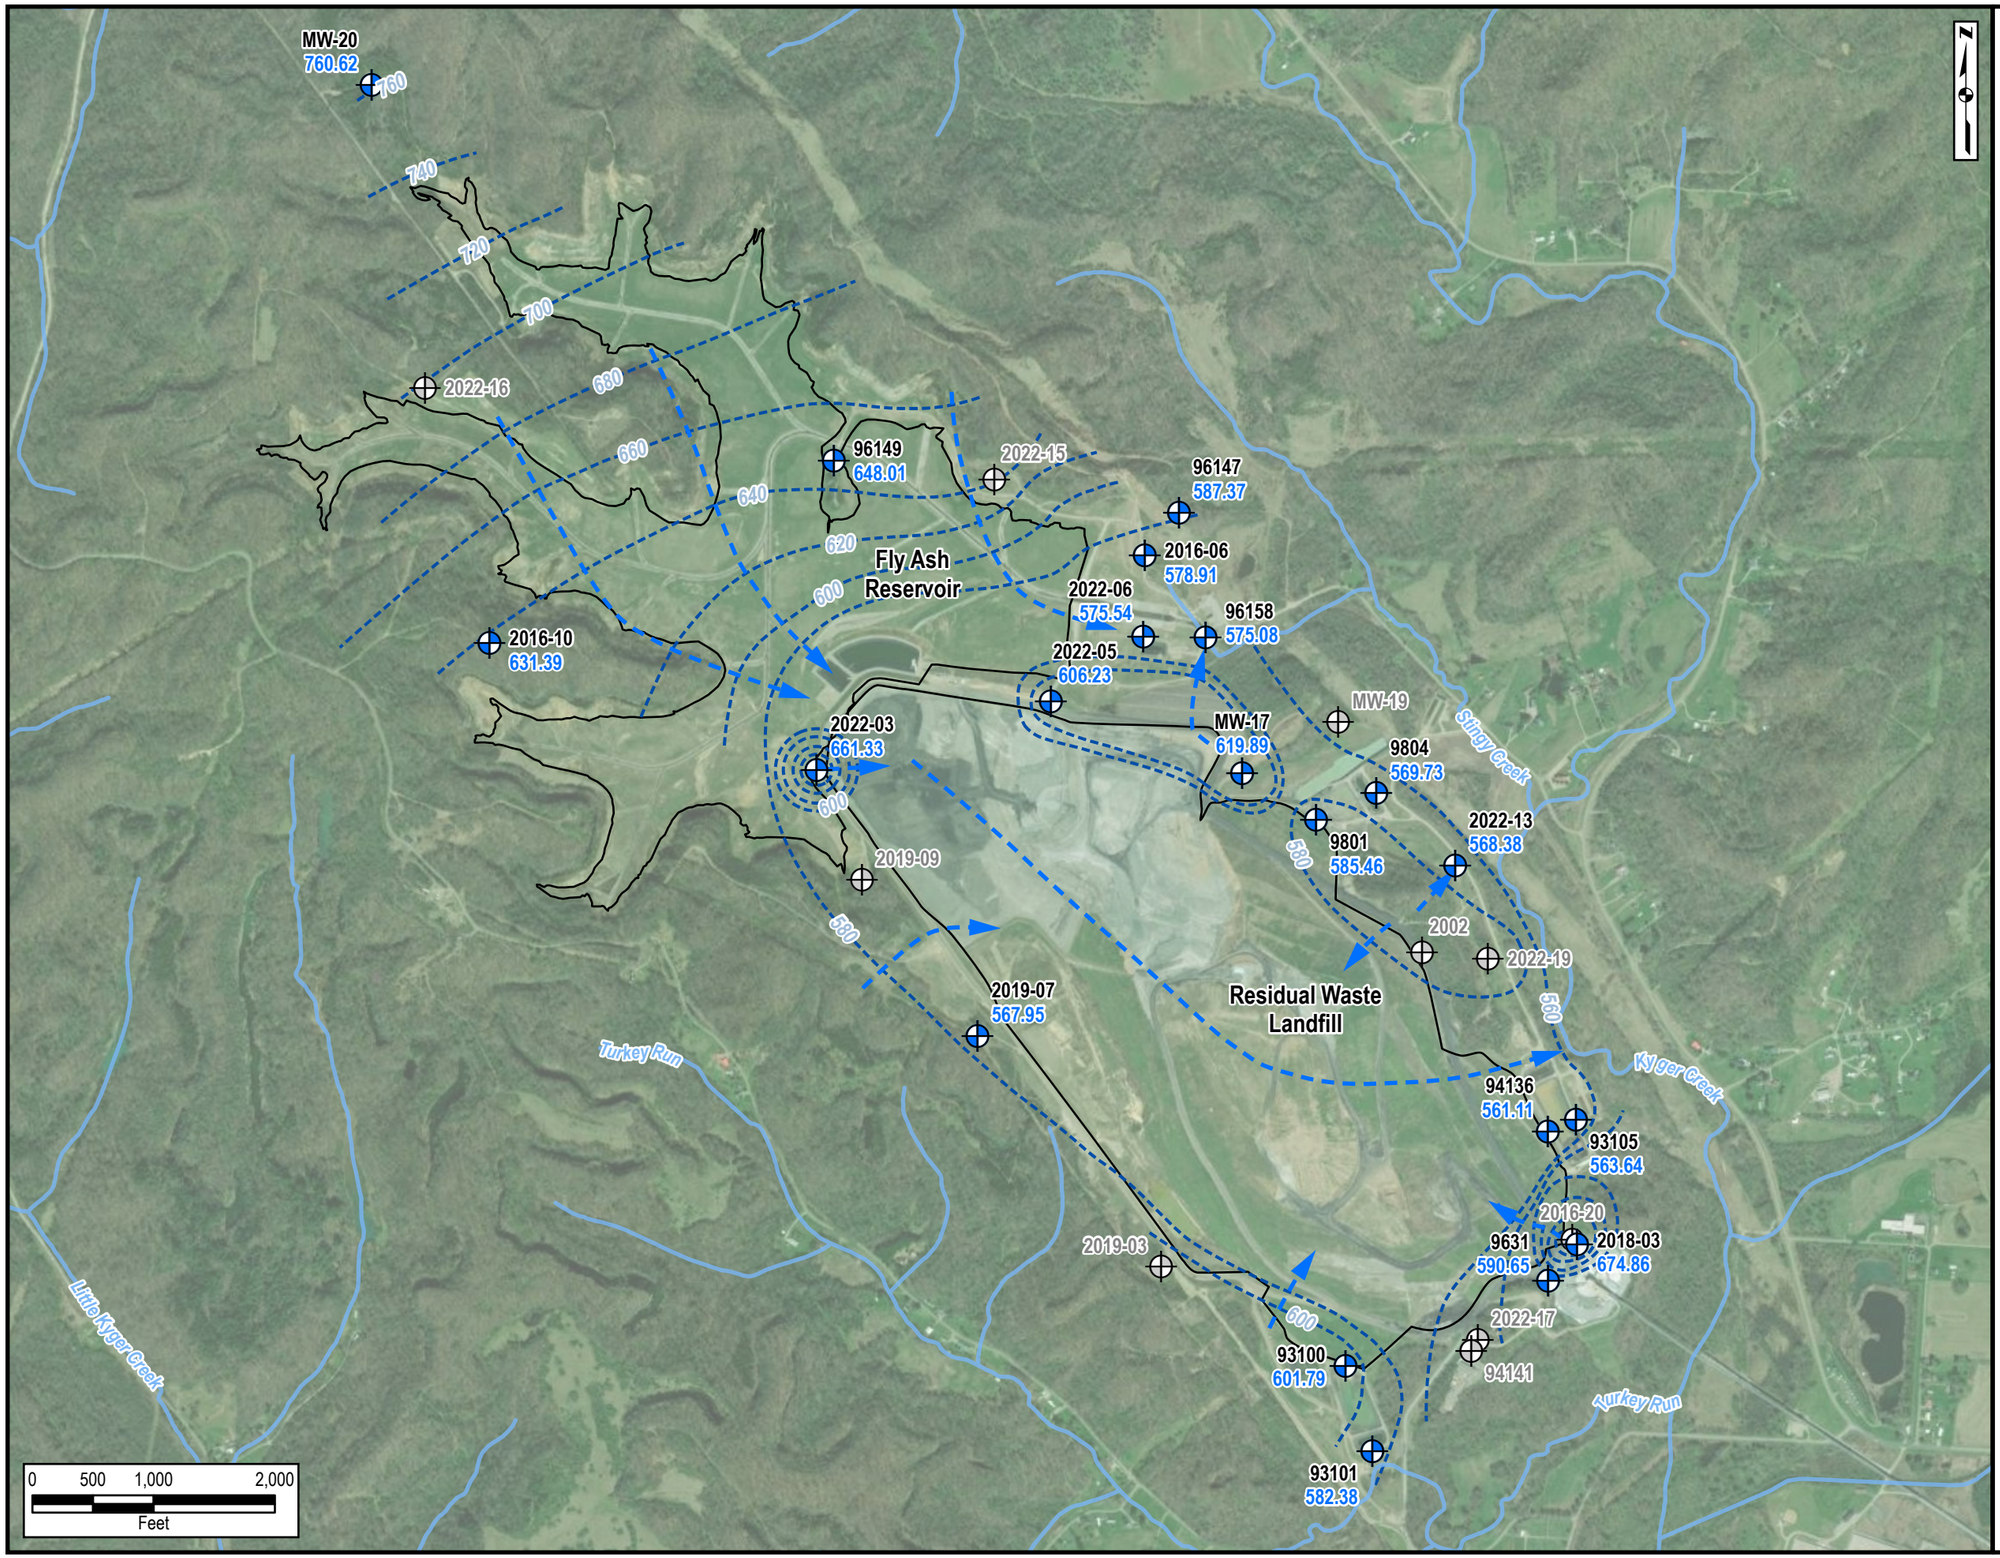
- Cow Run Sandstone is present through entire site.
- Interpreted contours based on groundwater gauging conducted on 3/4/2024 and 3/5/2024.
- Some groundwater elevation contours were interpreted using historical groundwater elevation trends in monitoring wells that were not gauged in March 2024.

Figure 5-2: Cow Run Sandstone Groundwater Flow Directions Spring 2024
Gavin Power, LLC
Cheshire, Ohio

ERM



NOTES:

- Interpreted contours based on groundwater gauging conducted on 8/26/2024 - 8/27/2024.
- Some groundwater elevation contours were interpreted using historical groundwater trends in monitoring wells that were not gauged in August 2024.
- Where the Morgantown SS is absent, the contours represent the potentiometric surface in the alluvial aquifer because these aquifers are hydraulically connected.
- H2 refers to the second half of 2024

SYSTEM **State Plane using NADA27**

GROUND ELEVATION 716.68 FT.

GROUT SEAL: 250 GALLONS QUICK GROUT

BENTONITE SEAL: 150 lbs 3/8" BENTONITE CHIPS

SCREEN: 2" dia., PVC, SLOT SIZE 20, 30'

GRAVEL PACK: 1050 lbs #4 QUARTZ

RISER PIPE: 2", dia., PVC

SPACERS, DEPTH: 130', 115' & 60'

Notes:
THIS IS A CLUSTERED SITE WITH R-2000 & R-2001

Deconned rig and tools prior to setup with 100 gallons potable water and alconox mix.
Water source was G-5 belthead.
Used 8" downhole hammer with water injection.
Used approx. 1500 gallons of water to drill this well and flush clean.
Used compressor to flush boring. Was making approx. 12 gallons/minute. Continued this process for 3.5 hours prior to installing well.
Spider spacers at 130', 115', & 60'
Seal hydrated by drill crew.

SWL at installation on 2/17/00 was at 109.5'
SWL at 129.2' on 2/23/00

Measurement from top of pipe to bottom of hole - 151.64'

SYSTEM **State Plane using NADA27**

GROUND ELEVATION 724.28 FT.

GROUT SEAL: APPROX. 200 GALLONS QUICK GROUT

BENTONITE SEAL: 100 lbs 3/8" BENTONITE CHIPS

SCREEN: 2" dia., PVC, SLOT SIZE 20, 20'

GRAVEL PACK: 550 lbs #4 QUARTZ

RISER PIPE: 2", dia., PVC

SPACERS, DEPTH: 135', 85', & 55'

Notes:
THIS WELL IS CLUSTERED WITH WELL R-2002.
THIS INSTALLATION WAS NOT AS PER J T MASSEY-NORTON

Potable water supply from G-5 belthead.
This well was drilled with a 5 7/8" roller bit, water & air.
The well boring was flushed with approx. 1000 gallons of potable water and then blown dry prior to well installation.
Bentonite seal was hydrated as placed in one foot lifts.
Spider spacers at 135', 85' & 55'.

SWL at installation was at 142'
Measurement from top of pipe to bottom is 144.7'

**5.3' of screen exposed to bentonite seal. (Note depths on top of screen and top of gravel pack)

Project Name: Residual Waste Landfill Monitoring Well Installation
Project Number: 0488799
Project Location: Cheshire, OH

DATE STARTED: 11/19/2019
DATE COMPLETED: 11/26/2019
DRILLING CONTRACTOR: Frontz Drilling, Inc.
DRILLING METHODS: Sonic Drilling/ Rock Coring
LOGGED BY: L. Velasquez
CHECKED BY: H. Usle
NOTES: Steel casing (6") advanced to 188 ft bgs; 4" rock coring to termination depth.

TOTAL DEPTH: 238 ft bgs
DIAMETER: 4-6 inches
GROUND ELEVATION: 747.77 ft amsl (approx.)
PVC ELEVATION: 750.77 ft amsl
NORTHING: 349139.275
EASTING: 2099336.769

WELL DEVELOPMENT
METHOD(S): PVC Bailer, Grundfos & Buffalo Pump
DATE STARTED: 4/22/2020
DATE ENDED: 5/22/2020
DTW AT START: 162.0 ft bgs
DTW AT END: 206.0 ft bgs
VOLUME PURGED: 17.7 gallons

Drilling Start Date:	03/08/2016 14:00	Boring Depth (ft):	60	Well Depth (ft):	54
Drilling End Date:	03/09/2016 08:50	Boring Diameter (in):	6	Well Diameter (in):	2
Drilling Company:	Frontz Drilling	Sampling Method(s):	Rock Core	Screen Slot (in):	0.010
Drilling Method:	Air Rotary	DTW During Drilling (ft):		Riser Material:	Sch 80 PVC
Drilling Equipment:		DTW After Drilling (ft):		Screen Material:	Sch 80 PVC 4" Pre-packed
Driller:		Top of Casing Elev. (ft):	650.97	Seal Material(s):	Bentonite Chips
Logged By:	M. Muenich	Location (X,Y):	N 351,787.1 E 2,101,641.7	Filter Pack:	Sidley #5 & #7 (Choker Sand)

DEPTH (ft)	LITHOLOGY	WATER LEVEL	WELL COMPLETION	COLLECT: Sample Type	COLLECT: Date & Time	COLLECT: Blow Counts	COLLECT: Recovery (in)	COLLECT: N Value RQD (%)	SOIL/ROCK VISUAL DESCRIPTION	REMARKS	DEPTH (ft)
40				Run 3			55/ 120	22			40
									(42.5') Silty SANDSTONE: strong to very strong, pale olive (10Y 6/2) and olive gray (5Y 3/2), micaceous, strongly cross-bedded, fine grained, fresh to slightly decomposed, competent to slightly disintegrated, moderately fractured. [MORGANTOWN]		
45											45
50				Run 4			75/ 120	30	(50') SANDSTONE: very strong, light bluish gray (5B 7/1), fine grained, micaceous, calcareous, fresh, competent, moderately to intensely fractured. [MORGANTOWN] End of [MORGANTOWN]		50
									(52.5') Sandy, silty SHALE: moderately strong to strong, dark greenish gray (5G 4/1), pyritic, slightly decomposed, intensely disintegrated, slightly fractured.		
55									(54') CLAYSTONE/CLAYSHALE: weak to moderately strong, very dark red (5R 2/6), moderately decomposed, intensely disintegrated, intensely fractured.	17:15 Stop drilling for day @ 55'; out of water. Continue drilling on 03/09/2016	55
									Well installed on 03/29/2016		
60									End of borehole at 60 ft bgs.	Finish coring @ 08:50 03/09/2016	60

Drilling Start Date:	10/03/2016 16:20	Boring Depth (ft):	134.1	Well Depth (ft):	119.4
Drilling End Date:	10/05/2016/ 09:40	Boring Diameter (in):	6	Well Diameter (in):	2
Drilling Company:	AEP Service Corp.	Sampling Method(s):	Rock Core	Screen Slot (in):	0.010
Drilling Method:	Rotary	DTW After Drilling (ft):	107.8	Riser Material:	Sch 40 PVC
Drilling Equipment:	Diedrich D-120	Ground Surface Elev. (ft):	727.961	Screen Material:	Sch 40 PVC Slotted
Driller:	Zach Racer	Top of Casing Elev. (ft):	730.757	Seal Material(s):	Bentonite Pellets and Grout
Logged By:	Doug Mateas	Location (X,Y):	N 349,987.86 E 2,102,252.07	Filter Pack:	Global #5 Sand

NOTES:
1) Coordinates are in Gavin Plant Coordinate System, which varies ±3 ft. from State Plane Ohio South NAD27. Elevation in NGVD1929.
2) "DTW after Drilling" refers to steady-state water level in open borehole (prior to well installation).
3) Geophysical logging used to interpret best depth interval to set the well screen.
4) Monitoring well screened in Morgantown Sandstone.

165	Run 12			119.5/ 120	51.3	(164.3') CLAYSHALE/CLAYSTONE: moderately strong, variegated colors of very dusky purple (5P 2/2), light olive brown (5Y 5/6) and dark reddish brown (10R 3/4), massive, slickensides, moderately decomposed, moderately disintegrated, intensely fractured.	
						(167.1') Clayey LIMESTONE: weak to moderately strong, dark reddish brown (10R 3/4) with secondary light olive brown (5Y 5/6) and very dusky purple (5RP 2/2), microcrystalline, slickensides, moderately to intensely decomposed, moderately disintegrated, moderately to intensely fractured.	
170						(171.7') CLAYSHALE: very strong, dark reddish brown (10R 3/4), massive, slickensides, fresh, competent, slightly fractured.	
175	Run 13			119/ 120	47.5	(174.3') Large amount of competently healed fractures with mud infillings.	
						(176.8') Changes to intensely fractured.	
180						(177.4') CLAYSTONE: weak to moderately strong, grayish red (5R 4/2) with minor secondary colors of light olive brown (5Y 5/6) and grayish red purple (5RP 4/2), massive, slickensides, moderately to highly decomposed, moderately disintegrated, intensely fractured.	

NOTES:
1) Coordinates are in Gavin Plant Coordinate System, which varies ±3 ft. from State Plane Ohio South NAD27. Elevation in NGVD1929.
2) "DTW after Drilling" refers to steady-state water level in open borehole (prior to well installation).
3) Geophysical logging used to interpret best depth interval to set the well screen.
4) Monitoring well screened in Morgantown Sandstone.

2022-16

Client: Gavin Power, LLC
Project Name: RWL/FAR Monitoring Well Installation
Project Number: 0643653
Project Location: Cheshire, OH

DATE STARTED: 8/7/2022
DATE COMPLETED: 8/9/2022
DRILLING CONTRACTOR: Cascade Drilling
DRILLING METHODS: Sonic Drilling & Wireline Rock Coring
LOGGED BY: L. Stodden
CHECKED BY: A. Harford
NOTES: 6" Steel Stickup Protective Casing. 2019-09 replacement well.

TOTAL DEPTH: 189 feet bgs
DIAMETER: 6 inches
GROUND ELEVATION: 736.19
PVC ELEVATION: 738.37
NORTHING: 353206.6888
EASTING: 2064228.927

WELL DEVELOPMENT
METHOD(S): Mega Monsoon & Bailer
DATE STARTED: 9/7/2022
DATE ENDED: 11/6/2022
DTW AT START: 124.95 feet bgs
DTW AT END: 187.0 feet bgs
VOLUME PURGED: 12.25 gallons

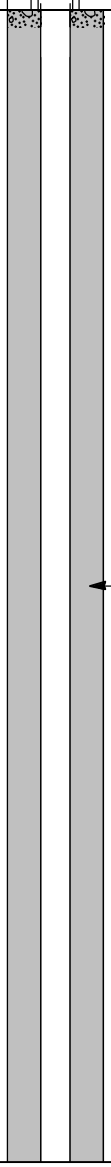
2022-19

Client: Gavin Power, LLC
Project Name: RWL/FAR Monitoring Well Installation
Project Number: 0643653
Project Location: Cheshire, OH



DATE STARTED: 7/25/2022
DATE COMPLETED: 7/26/2022
DRILLING CONTRACTOR: Cascade Drilling
DRILLING METHODS: Sonic Drilling & Wireline Rock Coring
LOGGED BY: J. Maag
CHECKED BY: A. Harford
NOTES: 6" Steel Stickup Protective Casing. 9396 replacement well.

TOTAL DEPTH: 119 feet bgs
DIAMETER: 6 inches
GROUND ELEVATION: 613.58
PVC ELEVATION: 616.04
NORTHING: 348497.3409
EASTING: 2072997.258

WELL DEVELOPMENT
METHOD(S): Mega Monsoon, Hurricane Pump & Bailer
DATE STARTED: 9/7/2022
DATE ENDED: 11/6/2022
DTW AT START: 112.65 feet bgs
DTW AT END: 119.0 feet bgs
VOLUME PURGED: 3.8 gallons

1. INTRODUCTION

1.1 REGULATORY AND LEGAL FRAMEWORK

In accordance with Title 40 Code of Federal Regulations (CFR), Part 257, Subpart D – Standards for the Disposal of Coal Combustion Residuals (CCR) in Landfills and Surface Impoundments (CCR Rule) – Gavin Power, LLC (Gavin) has been implementing the groundwater monitoring requirements of 40 CFR § 257.90 et seq. for its Residual Waste Landfill (RWL) and Fly Ash Reservoir (FAR) at the General James M. Gavin Power Plant (Plant) using a combined groundwater monitoring network for the RWL and FAR. Gavin calculated background levels and conducted statistical analyses for Appendix III constituents in accordance with 40 CFR § 257.93(h). Currently, Gavin is performing detection monitoring at the RWL and FAR in accordance with 40 CFR § 257.94.

Statistically significant increases (SSIs) over background concentrations were detected in downgradient monitoring wells for some Appendix III constituents for the first semiannual (H1) groundwater sampling event of 2024 and are explained in this Alternate Source Demonstration (ASD) Report. The first semiannual groundwater sampling event of 2024 was performed from March 8, 2024 to March 15, 2024. Review of data for quality assurance and statistical comparison was completed on May 8, 2024. Pursuant to 40 CFR § 257.94(e)(1), Gavin must establish an assessment monitoring program for the combined RWL/FAR groundwater monitoring system unless an Alternate Source Demonstration (ASD) is completed and certified by a Professional Engineer by August 6, 2024. This ASD Report, which has been completed and certified by the August 6, 2024 deadline, will be included with the annual groundwater monitoring and corrective action report required under CFR § 257.90(e), which is due January 31, 2025.

An SSI for one or more Appendix III constituents is a *potential* indication of a release of constituents from a CCR unit to groundwater. In the event of an SSI, the CCR Rule provides that "… the owner or operator may demonstrate that a source other than the CCR unit caused the SSI over background levels for a constituent or that the SSI resulted from error in sampling, analysis, statistical evaluation, or natural variation in groundwater quality…" (40 CFR § 257.94(e)(2)). If it is demonstrated that the SSI is the result of a source other than the CCR unit, then the CCR unit may remain in the Detection Monitoring Program instead of transitioning to an Assessment Monitoring Program. To implement this demonstration, an ASD must be made in writing and the accuracy of the information must be verified through certification by a qualified Professional Engineer (40 CFR § 257.94(e)(2)).

The United States Environmental Protection Agency (USEPA) guidance document, "Solid Waste Disposal Facility Criteria Technical Manual, EPA530-R-93-017, Subpart E" (USEPA 1993), specifies the following six lines of evidence that must be addressed to determine whether an SSI resulted from a source other than the regulated disposal unit:

- an alternative source exists;

- a hydraulic connection exists between the alternative source and the well with a statistically significant increase;
- constituent(s) (or precursor constituents) are present at the alternative source or along the flow path from the alternative source prior to possible release from the unit;
- the relative concentration and distribution of constituents in the zone of contamination are more strongly linked to the alternative source than to the unit when the fate and transport characteristics of the constituents are considered;
- the concentration observed in groundwater could not have resulted from the unit given the waste constituents and concentrations in the unit leachate and wastes, and the site hydrogeologic conditions; and
- the data supporting conclusions regarding the alternative source are historically consistent with the hydrogeologic conditions and findings of the monitoring program.

This ASD Report addresses each of these lines of evidence for the SSIs detected in groundwater collected from downgradient compliance wells at the RWL and FAR. The groundwater monitoring program and ASD have been prepared utilizing accepted practices incorporating both site specific and regional information.

Some of the topics discussed in this report are also addressed in USEPA's November 22, 2022 Final Decision: Denial of Alternative Closure Deadline for General James M. Gavin Plant, Cheshire, Ohio (Final Decision). In other documents, Gavin has explained how the approaches described and documented in this report are consistent with USEPA regulations and guidance as well as with best engineering practices and judgment. Gavin has contested USEPA's findings in the Final Decision from a factual, technical and legal perspective. ERM notes that USEPA's findings and determinations in the Final Decision are the subject of pending litigation.

1.2 BACKGROUND

The Plant is a coal-fired generating station located in Cheshire, Gallia County, Ohio (Figure 1-1), and is bounded to the east by the Ohio River. The RWL and FAR are two of three CCR units at the Plant that are subject to regulation under the CCR Rule (the third unit is the Bottom Ash Pond (BAP) but that unit is not discussed in this report). The RWL is approximately 400 acres in size and is located about 1.25 miles northwest of the Plant (Figure 1-2). The CCR material disposed in the RWL is Flue Gas Desulfurization (FGD) byproduct (consisting of scrubber cake, fly ash, and lime) and other approved materials (bottom ash, lime ball mill rejects, coal pulverizer rejects, and BAP sediments).

The FAR is approximately 300 acres in size and is located about 2.5 miles northwest of the Plant (Figure 1-2). From the mid-1970s until January 1995, fly ash was sluiced to the FAR and the settled CCR materials in the FAR were retained behind the Stingy Run Fly Ash Dam that formed the FAR. The FAR was closed in place, and the closure was completed in 2021. Closure was certified on July 30, 2021.

An updated combined groundwater monitoring system was certified in August 2021 to collectively monitor for potential releases from the RWL and FAR. Previously, Gavin maintained and monitored two separate (though adjacent) groundwater monitoring networks for the RWL and FAR, respectively. The combined monitoring network was certified on 31 August 2021 with completion of the Updated Groundwater Monitoring System Evaluation and Certification—40 CFR 257.91 (ERM 2021).

The combined network which monitors both the RWL (Figure 1-3) and FAR (Figure 1-4) currently includes 24 upgradient and 15 downgradient monitoring wells located in the Alluvium, Morgantown Sandstone, and Cow Run Sandstone. The upgradient wells are placed to accurately represent the quality of background groundwater that has not been affected by any potential leakage from the RWL and FAR units, while the downgradient wells in the network are positioned at the downgradient boundary of waste to detect potential release of CCR constituents from the CCR units into groundwater in the uppermost aquifer.

Consistent with the CCR Rule and with Gavin's Statistical Analysis Plan (ERM 2017), an interwell prediction limit approach was used to identify potential impacts to groundwater. Upper prediction limits were developed for the Appendix III parameters; in the case of pH, a lower prediction limit was also developed. Documentation of the development of the upper prediction limits and lower prediction limit is provided in the 2018 Alternate Source Demonstration for the RWL (ERM 2018b).

In 2022, six new monitoring wells were installed around the RWL and FAR to act as replacements for previously existing monitoring wells that were part of the certified monitoring network but that had to be removed as a result of a variety of factors, including landfill expansion activities. In addition, another eight new wells were installed in 2022 around the RWL and FAR to monitor groundwater in between existing monitoring well locations. Sampling is occurring at these wells, which are also being evaluated for addition to the monitoring network but have not yet been added to the certified network.

1.3 GEOLOGY AND HYDROGEOLOGY

The shallowest geologic materials at the FAR/RWL include residual soils, mine spoil, fill, and weathered and fractured bedrock (ERM 2021). Measured hydraulic conductivities for fine-grained soils range from 1.03×10^{-8} centimeters per second (cm/sec) to 5.60×10^{-9} cm/sec. The shallowest weathered and fractured bedrock includes the Pomeroy Sandstone and Coal, the Pittsburgh Sandstone and Coal, the Bellaire Sandstone, and the Connellsville Sandstone units. Although some of these units may be partially or fully saturated in the vicinity of the FAR and RWL, these formations generally are not capable of yielding usable quantities of groundwater, and thus are not considered part of the uppermost aquifer at the FAR/RWL. Bedrock dip is to the southeast at approximately 17 feet/mile (AEP 1993). Geologic cross sections for the RWL and FAR are provided as Figure 1-5 and Figure 1-6, respectively.

Beneath the Connellsville Sandstone are the Clarksburg Red Beds, which is a regionally extensive aquitard (low-permeability rock layer), with a typical thickness of approximately 50 feet, that

hydraulically isolates the shallower formations from the underlying aquifers. Beneath the Clarksburg Red Beds are the Morgantown Sandstone and the Cow Run Sandstone. Together these are interpreted as the uppermost aquifer beneath the RWL and FAR (Geosyntec 2016a; Geosyntec 2016b).

The Morgantown Sandstone has an average thickness of approximately 30 feet and is composed of two thin sandstone beds separated by clay shale. East of the RWL, the Morgantown Sandstone has been removed by erosion and is absent, and groundwater migrating eastward within the Morgantown Sandstone discharges to the alluvial aquifer located along the Stingy Creek valley. In these areas (i.e., where the Morgantown Sandstone is absent) ,the alluvial aquifer is also considered part of the uppermost aquifer.

Below the Morgantown Sandstone is a unit of approximately 60 feet of interbedded claystone/clay shale and non-crystalline limestone layers, known as the Round Knob Shale. These strata extend to the top of the Cow Run Sandstone. The two bedrock units, the Connellsville Sandstone and the Morgantown Sandstone, have been partially-to-completely eroded in portions of the valley areas of the FAR. The Connellsville Sandstone has been completely eroded away in all valley areas and the deeper Morgantown Sandstone has been completely eroded away in the eastern portions of the FAR valley near the former Fly Ash Dam (FAD) as seen in borings advanced in 2022 (ERM 2024). Together, the residual clay soils and deeper Round Knob Shale unit provide hydraulic separation from the aquifers underlying the FAR.

The Cow Run Sandstone has an average thickness of 30 feet and is characterized regionally as a coarse-grained sandstone and sandy shale. The Cow Run Sandstone unit is continuous under the FAR/RWL and considered the base of the uppermost aquifer. Beneath the Cow Run Sandstone are the Portersville Limestone and the Anderson Clay, which consist primarily of shale, claystone, and clay shale (AEP and Geosyntec 2012). These low permeability formations are interpreted to comprise the lower hydraulic boundary of the uppermost aquifer.

1.3.1 GROUNDWATER FLOW

The removal of strip mine ponds, installation of groundwater intercept (GWI) drains, and placement of the composite liner under the RWL resulted in decreased recharge to the Morgantown Sandstone and Cow Run Sandstone. The changes during and post-construction were interpreted to result in the decline of potentiometric elevations up to 10 feet, which is similar to observed declines at another AEP residual waste landfill (AEP 1993).

Groundwater within the Morgantown Sandstone and Cow Run Sandstone generally flows from the northwest to the southeast under the FAR and the RWL (Figure 1-7 and Figure 1-8). To the west of the FAR/RWL, groundwater flows from west to east before joining the overall flow pattern to the southeast. There is a potentiometric trough that extends from the FAR through the RWL that is interpreted to be the result of reduced recharge due to suppression of infiltration through the cap at the FAR, and the liner system at the RWL. There is a potentiometric ridge located along the eastern border of the RWL that divides groundwater flow, with water to the northeast of this ridge flowing to the northeast, and water to the southwest of the ridge flowing to the southwest before

joining the overall flow pattern to the southeast. These groundwater flow interpretations are generally consistent with pre-construction observations (AEP 1993).

At the FAR, shallow groundwater flow exhibits a subdued reflection of Site topography. No additional monitoring wells that could be used to determine potentiometric water levels or assess groundwater flow have been installed within the footprint of the closed FAR because of the complications associated with drilling through CCR materials.

1.4 2024 H1 GROUNDWATER SAMPLING EVENT

The data from the first semiannual groundwater sampling event from 2024 were compared to the upper and lower prediction limits for the Appendix III parameters, and SSIs for Appendix III analytes were identified. Tables 1-1 and 1-2 summarize occurrences of SSIs from the March 2024 sampling event.

TABLE 1-1 SSIS IN MORGANTOWN SANDSTONE AND ALLUVIUM DOWNGRADIENT MONITORING WELLS[1]

This ASD Report identifies the regional discharge of naturally occurring brine originating from bedrock as the source of calcium, chloride, and total dissolved solids (TDS) detected in groundwater collected from monitoring well 9631. Supporting information and additional discussion of the lines of evidence are presented in subsequent sections of this ASD Report.

[2] Notes: ϕ = no SSI; X = SSI; SSI = statistically significant increase; NS= not sampled
i) Well 2018-01 was abandoned in 2022. A replacement monitoring well is currently being evaluated.
ii) The SSI for total dissolved solids was detected only in the field duplicate and not in the normal sample. Despite the lack of an SSI in the normal sample, the SSI for total dissolved solids in the duplicate sample is addressed in this Alternate Source Demonstration Report.

2. DESCRIPTION OF ALTERNATE SOURCES

Regional Brine is identified as the alternate source for the calcium, chloride, and TDS that are observed at the FAR/RWL. This a due to naturally occurring brine originating in/from bedrock (i.e., Cow Run Sandstone) as observed in shallow groundwater in and around Gavin.

A summary of regional brine and its influence on groundwater quality is provided below.

2.1 REGIONAL BRINE

Naturally occurring brine, which is known in the Ohio River Valley to have elevated levels of calcium, chloride, and other trace elements, exists in the subsurface (Stout et al. 1932; ORSANCO 1984; ODNR 1995). The discharge of brines is seen at a regional scale, with shallow wells near the Ohio River observing brine impacts because of the vertical head gradient driving overall flow upwards from bedrock to alluvium (USGS 1997). The Cow Run Sandstone is the shallowest sandstone of any importance in Ohio where brine of marine origin has been observed (Phalen 1919; Stout et al. 1932). Brine was discovered at the land surface approximately 10 miles southwest of the Plant in Gallipolis, Ohio and was utilized for the commercial production of salt beginning in 1807. This commercial production was enhanced by advancing a boring to a depth of 100 feet below ground surface, which resulted in a brine much stronger than found at the land surface (Stout et al. 1932). Naturally occurring brine was also identified at the land surface in Jackson, Ohio approximately 30 miles west of the Plant (ODNR 1995). The regional presence of shallow brine indicates the potential for naturally occurring brine to contribute Appendix III constituents in groundwater at the Plant. Evidence of brine impacts near the Plant includes specific conductivity measurements at several Cow Run Sandstone monitoring wells upgradient of the RWL and FAR that are consistently greater than 30,000 µS/cm and reach as high as 50,062 µS/cm at monitoring well 2019-07. For reference, the approximate specific conductivity of seawater is 50,000 µS/cm (USGS 2019). The same upgradient wells have historically contained elevated levels of constituents like calcium and chloride which range as high as 1,000 mg/L and 23,000 mg/L, respectively.

The background groundwater data set is discussed further in Section 4.

3. HYDRAULIC CONNECTIONS TO THE ALTERNATE SOURCES

Explanations of the hydraulic connections between potential alternate sources and downgradient wells at the FAR/RWL were provided in the first ASD Reports for the FAR and RWL (ERM 2018a, ERM 2018b) – see below. Groundwater potentiometric contour maps for the Morgantown and Cow Run Sandstone are depicted in Figures 1-7 and 1-8, respectively.

3.1 HYDRAULIC CONNECTION TO REGIONAL BRINE

Regional groundwater within the fractured sedimentary bedrock in the Ohio River Valley generally flows from areas of higher topographic elevation towards areas of lower elevation, ultimately discharging to the Ohio River (ORSANCO 1984). Precipitation infiltrates the land surface to recharge the underlying aquifers below, and flow of groundwater within these aquifers is primarily driven by the gravitational force on groundwater (differences in hydraulic head) within the bedrock. The Cow Run Sandstone extends west of the FAR/RWL where naturally occurring brine (with elevated calcium, chloride, and TDS) is known to impact Cow Run groundwater (Phalen 1919, Stout et. al. 1932). The section of the aquifer under the southeastern portion of the FAR and extending toward the southeast under the RWL in the Morgantown and Cow Run Sandstone contains a region of lower hydraulic pressure (in comparison to the surrounding areas). The pathway for regional groundwater flows through the fractured bedrock from the northern and western regions under the FAR/RWL that have access to brine, to the lower pressure southern and eastern regions toward the Ohio River. The forested and pastured areas surrounding the FAR and RWL are more permeable and exhibit greater infiltration than the fine-grained, compacted material within the FAR and RWL. Based on these considerations, the fractured rock of the sandstones is hydraulically connected to the potential alternate source of calcium, chloride, and TDS.

3.1.1 HYDRAULIC CONDUCTIVITY

Packer tests were completed in 2012 to assess hydraulic conductivity for locations in both the Morgantown and Cow Run Sandstone around the northern portion of the RWL (AEP and Geosyntec 2012). The range of hydraulic conductivity values from the packer tests in the Morgantown and Cow Run are provided in Table 3-1.

TABLE 3-1: ESTIMATED HYDRAULIC CONDUCTIVITY VALUES FOR MORGANTOWN AND COW RUN SANDSTONE[3]

	Average K	Low K	High K
Morgantown (Geosyntec 2012)	7.18 x 10^{-5} cm/sec	2.2 x 10^{-8} cm/sec	4.6 x 10^{-4} cm/sec
Cow Run (Geosyntec 2012)	2.92 x 10^{-5} cm/sec	5.0 x 10^{-8} cm/sec	5.9 x 10^{-4} cm/sec

The velocity of groundwater flowing through the Morgantown Sandstone was estimated in 2023 based on the measured horizontal hydraulic gradient (0.010 feet/feet), estimated hydraulic conductivity of 7.18 x 10^{-5} centimeters per second (AEP and Geosyntec 2012), and an estimated effective porosity value of 0.01 for fractured bedrock. The estimated groundwater velocity calculated is approximately 77 to 78 feet/year (ERM 2024).

The velocity of groundwater flowing through the Cow Run Sandstone was estimated for 2023 based on the measured horizontal hydraulic gradient (0.010 feet/feet), the estimated hydraulic conductivity of 2.92 x 10^{-5} centimeters per second (AEP and Geosyntec 2012), and an effective porosity value of 0.01 for fractured bedrock. The estimated groundwater velocity calculated is approximately 31 feet/year (ERM 2024).

Fractures observed at the site vary in frequency, distribution, and orientation as seen by the variability in monitoring well recharge rates and the measured hydraulic conductivity (Table 3-1). Groundwater flow is expected to occur primarily through the fractures, as the porosity of the fractures is expected to be much greater than the porosity of the rock matrix. Mine-roof collapse in underground mines commonly causes the overlying rocks to settle and fracture (AEP 1993). This settling may cause subsidence and the vertical propagation of extensive fractures to the land surface. Vertical seepage can also occur to lower aquifers along these steeply inclined stress relief fractures (AEP 1993). As such, areas of the Site that were previously mined are expected to act as recharge areas.

[3] Notes: i) cm/sec = centimeters per second; K = hydraulic conductivity
ii) Geosyntec 2012 values derived from packer tests (10-foot interval) completed in boreholes across mainly the northern part of the RWL.

4. CONSTITUENTS ARE PRESENT AT THE ALTERNATE SOURCES OR ALONG THE FLOW PATHWAYS

Regional brine is identified as the source of calcium, chloride, and TDS in FAR/RWL downgradient groundwater. Groundwater quality at the FAR/RWL is also influenced by external sources, as described in Sections 2, 3, and 7.

4.1 REGIONAL BRINE

Regional brine, as discussed above, is present in the area of the Plant and locally in bedrock under the FAR/RWL. Federal monitoring wells 2019-07 and 2019-09, which were installed upgradient of the RWL in Cow Run Sandstone, have chemical signatures indicating brine. In addition to the brine signatures observed in upgradient RWL wells, brine signatures have also been detected in Cow Run wells located at the BAP. The ranges for calcium, chloride, and TDS in upgradient Morgantown groundwater (2019-02 and 2019-06), upgradient Cow Run groundwater (2019-07 and 2019-09), and brine-impacted wells located at the BAP (BAC-09, BAC-11, BAC-13, BAC-19) are presented in Table 4-1.

TABLE 4-1 CONCENTRATIONS IN ON-SITE BRINE IMPACTED BEDROCK GROUNDWATER[4]

Analyte	Units	Upgradient Morgantown Groundwater at the RWL	Upgradient Cow Run Groundwater at the RWL	Bedrock Groundwater at the BAP
Calcium	mg/L	27-310	850-910	55-2,500
Chloride	mg/L	110-12,000	19,000-20,000	460-25,000
TDS	mg/L	1,300-14,000	24,000-25,000	1,600-35,000

Based on a review of permit applications for historical oil and gas wells installed within the Gavin property by prior owners, the Ohio Department of Natural Resources (ODNR) routinely required applicants to identify the company responsible for collecting, transporting, and disposing of salt water to be produced by the proposed well. Oil and gas wells in the vicinity of the Gavin plant were typically drilled to a depth of approximately 1,800 feet below ground surface and recovered brine was temporarily stored in pits at the wellsite prior to offsite disposal. In addition, the permits demonstrate that the boreholes were typically not sealed below 250 feet below ground

[4] Notes: i) mg/L = milligrams per liter; TDS = total dissolved solids
ii) Upgradient Morgantown Groundwater at the RWL includes data from monitoring wells 2019-02 and 2019-06 and represents a range of values obtained from September 2020 to February 2024
iii) Upgradient Cow Run Groundwater at the RWL includes data from monitoring wells 2019-07 and 2019-09 samples collected in March 2024
iv) Bedrock Groundwater at the BAP includes data from monitoring wells BAC-09, BAC-11, BAC-13, BAC-19 samples collected in March 2024

surface if oil and gas were not found, which would leave an unsealed borehole that could allow the upward migration of brine to shallower strata, including the Cow Run. These ODNR records demonstrate the naturally occurring presence of brine at the Gavin property in geologic strata located beneath the Cow Run Sandstone and the potential for upward migration of brine through unsealed boreholes (ODNR 2024).

The elevated concentrations of calcium, chloride, and TDS in the upgradient bedrock groundwater indicate that these constituents are present in brine at the regional level.

5. LINKAGES OF CONSTITUENT CONCENTRATIONS AND DISTRIBUTIONS BETWEEN ALTERNATE SOURCES AND DOWNGRADIENT WELLS

5.1 REGIONAL BRINE

As discussed in Sections 2 and 4, the concentrations of calcium, chloride, and TDS are elevated in regional brine. Table 4-1 demonstrates that the concentration of calcium, chloride, and TDS are higher in Cow Run groundwater upgradient of the RWL than in Morgantown groundwater in the area. This is indicative of a source emanating from a deeper stratum (e.g. where brine is found). As demonstrated in Section 4, oil & gas well permits indicate that brine is present in the area of the RWL/FAR.

Table 5-1 demonstrates that the concentrations of calcium, chloride, and TDS observed at monitoring well 9631 are consistent with upgradient wells impacted by regional brine. Regionally, concentrations of calcium exceeding 10,000 mg/L, chloride exceeding 50,000 mg/L, and TDS exceeding 100,000 mg/L have been observed in Ohio brines (Stout et. al. 1932). Thus, regional brine impacting bedrock groundwater is the alternate source of calcium, chloride, and TDS. The pathway for regional groundwater follows hydraulic pressure gradients through the fractured Cow Run Sandstone from the northern and western regions under the FAR/RWL, to the southern and eastern regions toward the Ohio River. As described in Section, 3.1.1, hydraulic conductivity of the underlying bedrock varies at the site, resulting in brine impacts being localized to individual zones.

TABLE 5-1: COMPARISON OF BRINE IMPACTED BEDROCK TO DOWNGRADIENT WELL 9631[5]

Analyte	Units	Maximum Brine-Impacted Groundwater in Upgradient Bedrock RWL/FAR (As measured at 2019-07)	Monitoring Well 9631
Calcium	mg/L	910	1,600
Chloride	mg/L	20,000	28,000
TDS	mg/L	25,000	33,000*

[5] Notes: i) RWL/FAR = residual waste landfill/fly ash reservoir; mg/L = milligrams per liter
ii) *TDS result is from a field duplicate sample
iii) Results from groundwater samples collected in March 2024

6. DATA DOES NOT INDICATE THAT THE FAR/RWL IS THE SOURCE

6.1 GEOCHEMICAL SIGNATURES

The geochemical fingerprints of landfill leachate from the RWL and downgradient well 9631 were evaluated using the concentrations of Appendix III parameters. Landfill leachate is characterized by elevated concentrations of boron, chloride, and sulfate – concentrations of these parameters in groundwater from well 9631 and leachate from Ponds 1 and 2 are shown in Figure 6-1. These parameters were selected due to their elevated concentrations in site landfill leachate, their high water solubility, limited potential for sorption, and limited potential for transformations under the redox conditions observed at well 9631.

The samples presented in these time series plots were collected from 2010 through 2024. The primary observations based on these plots are the following.

- Sulfate is consistently one-to-two orders of magnitude higher in landfill leachate than in groundwater from monitoring well 9631. The increasing concentrations of calcium, chloride, and TDS in groundwater from well 9631 were not accompanied by an increase in sulfate concentrations. Given the elevated concentrations of sulfate in landfill leachate, a release from the landfill could not occur without a concurrent increase in the concentration of sulfate in downgradient wells.
- In contrast, chloride has been consistently higher at monitoring well 9631 than in landfill leachate. Monitoring well 9631 was not sampled in 2022 or 2023 due to malfunctions with the pump. After a new pump was installed in December 2023, samples were collected in February and March of 2024. Chloride concentrations increased sharply compared to data collected in 2021 or earlier. A release of landfill leachate would result in a decrease in the concentration of chloride at monitoring well 9631, which did not occur.
- Boron is consistently an order of magnitude higher in landfill leachate than in groundwater collected from monitoring well 9631. The increasing concentrations of calcium, chloride, and TDS in groundwater from well 9631 were not accompanied by an increase in boron concentrations. Boron is expected to act as a conservative tracer due to its high solubility and mobility in water. Therefore, a release of landfill leachate would result in an increase in boron concentrations, which was not observed from 2010 through spring 2024.

A release from the RWL/FAR would result in increasing concentrations of boron and sulfate, and decreasing concentrations of chloride at monitoring well 9631. In contrast, chloride has increased since 2021 while boron and sulfate have remained stable. Further, a release from the RWL/FAR would need to migrate from the surface through the Morgantown Sandstone before concentrations would increase in the Cow Run Sandstone. SSIs were not detected in any downgradient wells screened in the Morgantown Sandstone.

Based on the data summarized above and the chemical signatures of the groundwater at issue, the RWL/FAR is not deemed to be the source of the SSIs.

7. ALTERNATE SOURCE DATA ARE HISTORICALLY CONSISTENT WITH HYDROGEOLOGIC CONDITIONS AND FINDINGS OF THE MONITORING PROGRAM

7.1 REGIONAL BRINE

The existence of Regional Brine in the area surrounding the plant is supported by historical studies and data. Regional groundwater flow regimes through fractured bedrock upgradient of the FAR/RWL were established after the last deglaciation, which occurred approximately 14,000 years ago (Hansen 2017). Enhancement of transmissivity in Ohio River Valley from stress-relief fracturing in bedrock provides conditions for bedrock to be interconnected to coarse glacial outwash alluvial deposits (USGS 1981; USGS 1997). Regional groundwater within the fractured sedimentary bedrock in the Ohio River Valley generally flows from areas of higher topographic elevation towards areas of lower elevation, ultimately discharging to the Ohio River (ORSANCO 1984). Assuming a conservatively high effective porosity of 1 percent, estimated groundwater velocity values for the Morgantown Sandstone and Cow Run Sandstone units are approximately 77 feet per year and 31 feet per year, respectively. These flow rates would allow ample time for groundwater to migrate from upgradient regional background sources to Plant property. The data supporting these conclusions are historically consistent with hydrogeologic conditions and findings of the RWL-FAR monitoring program.

The discharge of brines is seen at a regional scale along the Ohio River with shallow wells near the Ohio River observing saltwater impacts; whereas, further from the Ohio River shallow wells report little to no brine impacts (USGS 1997). At the site, upward gradients between bedrock and alluvial wells near the Ohio River have been observed, and locations with the strongest observed upward gradients generally have high hydraulic conductivities, which supports the conclusion that bedrock and alluvial aquifers are hydraulically connected on-site. Total dissolved solids, magnesium, and sodium concentrations observed in bedrock wells around the FAR/RWL are consistent with observations seen at brine-freshwater mixing zones at other brine-impacted sites (Yager et al. 2017). The regional and site-specific data are in strong agreement, therefore, and lead to the conclusion that regional brines are discharging under the FAR/RWL and mixing with Cow Run groundwater upgradient to the FAR/RWL.

8. CONCLUSIONS

The SSIs identified in this ASD Report are based on results from downgradient FAR/RWL monitoring well samples collected in March 2024. Review of data for quality assurance and statistical comparison was completed on May 8, 2024. In response to the SSIs, this ASD Report was prepared within the required 90-day period in accordance with 40 CFR § 257.94(e)(2).

SSIs in the downgradient RWL/FAR monitoring wells have been determined to result from alternate sources based on analysis of the gathered data: discharge of regional brine present in bedrock. Table 8-1 summarizes the six lines of evidence for each of the SSIs.

In conclusion, the FAR/RWL is not the source of the SSIs associated with the fist semiannual sampling event groundwater results for 2024. Thus, Gavin will continue detection monitoring at the FAR/RWL in accordance with 40 CFR § 257.94(e)(2).

TABLE 8-1: FAR/RWL ASD SUMMARY[6]

Analyte	SSI Location	Six Lines of Evidence from USEPA Guidance					
		Alternate Source	**Hydraulic Connection**	**Constituent Present at Source or along Flow Path**	**Constituent Distribution More Strongly Linked to Alternate Source**	**Constituent Could Not Have Resulted from the FAR/RWL**	**Data Are Historically Consistent with Hydrogeologic Conditions**
Calcium	9631	Regional Brine	X	X	X	X	X
Chloride	9631	Regional Brine	X	X	X	X	X
TDS	9631	Regional Brine	X	X	X	X	X

[6] Notes: FAR/RWL = fly ash reservoir/ residual waste landfill; SSI = statistically significant increase; USEPA = United States Environmental Protection Agency.

PROFESSIONAL ENGINEER CERTIFICATION

I hereby certify that I, or an agent under my review, have prepared this Alternate Source Demonstration Report for the Residual Waste Landfill/Fly Ash Reservoir and it meets the requirements of 40 CFR § 257.94(e)(2). To the best of my knowledge, the information contained in this Report is true, complete, and accurate.

1. INTRODUCTION

1.1 REGULATORY AND LEGAL FRAMEWORK

In accordance with Title 40 Code of Federal Regulations (CFR), Part 257, Subpart D – Standards for the Disposal of Coal Combustion Residuals (CCR) in Landfills and Surface Impoundments (CCR Rule) – Gavin Power, LLC (Gavin) has been implementing the groundwater monitoring requirements of 40 CFR § 257.90 et seq. for its Residual Waste Landfill (RWL) and Fly Ash Reservoir (FAR) at the General James M. Gavin Power Plant (Plant) using a combined groundwater monitoring network for the RWL and FAR. Gavin calculated background levels and conducted statistical analyses for Appendix III constituents in accordance with 40 CFR § 257.93(h). Currently, Gavin is performing detection monitoring at the RWL and FAR in accordance with 40 CFR § 257.94.

Statistically significant increases (SSIs) over background concentrations were detected in one downgradient monitoring well for some Appendix III constituents for the second semiannual (H2) groundwater sampling event of 2024 and are explained in this Alternate Source Demonstration (ASD) Report. The second semiannual groundwater sampling event of 2024 was performed from September 10, 2024 to November 1, 2024. Review of data for quality assurance and statistical comparison was completed on December 16, 2024. Pursuant to 40 CFR § 257.94(e)(1), Gavin must establish an assessment monitoring program for the combined RWL/FAR groundwater monitoring system unless an ASD is completed and certified by a Professional Engineer within 90 days. Pursuant to 40 CFR § 257.94(e)(2), this ASD Report, which has been completed and certified by the January 31, 2025 deadline, will be included with the annual groundwater monitoring and corrective action report required under CFR § 257.90(e), which is due January 31, 2025.

An SSI for one or more Appendix III constituents is a *potential* indication of a release of constituents from a CCR unit to groundwater. In the event of an SSI, the CCR Rule provides that "… the owner or operator may demonstrate that a source other than the CCR unit caused the SSI over background levels for a constituent or that the SSI resulted from error in sampling, analysis, statistical evaluation, or natural variation in groundwater quality…" (40 CFR § 257.94(e)(2)). If it is demonstrated that the SSI is the result of a source other than the CCR unit, then the CCR unit may remain in the Detection Monitoring Program instead of transitioning to an Assessment Monitoring Program. To implement this demonstration, an ASD must be made in writing and the accuracy of the information must be verified through certification by a qualified Professional Engineer (40 CFR § 257.94(e)(2)).

The United States Environmental Protection Agency (USEPA) guidance document, "Solid Waste Disposal Facility Criteria Technical Manual, EPA530-R-93-017, Subpart E" (USEPA 1993), specifies the following six lines of evidence that must be addressed to determine whether an SSI resulted from a source other than the regulated disposal unit:

- An alternative source exists;

- A hydraulic connection exists between the alternative source and the well with a statistically significant increase;
- Constituent(s) (or precursor constituents) are present at the alternative source or along the flow path from the alternative source prior to possible release from the unit;
- The relative concentration and distribution of constituents in the zone of contamination are more strongly linked to the alternative source than to the unit when the fate and transport characteristics of the constituents are considered;
- The concentration observed in groundwater could not have resulted from the unit given the waste constituents and concentrations in the unit leachate and wastes, and the site hydrogeologic conditions; and
- The data supporting conclusions regarding the alternative source are historically consistent with the hydrogeologic conditions and findings of the monitoring program.

Environmental Resources Management, Inc. (ERM) has prepared this ASD Report on behalf of Gavin to address each of these lines of evidence for the SSIs detected in groundwater collected from downgradient compliance wells at the RWL and FAR. The groundwater monitoring program and ASD have been prepared utilizing accepted practices incorporating regional information that has been confirmed with site specific measurements.

Some of the topics discussed in this report are also addressed in USEPA's November 22, 2022 Final Decision: Denial of Alternative Closure Deadline for General James M. Gavin Plant, Cheshire, Ohio (Final Decision). In other documents, Gavin has explained how the approaches described and documented in this report are consistent with USEPA regulations and guidance as well as with best engineering practices and judgment. Gavin has contested USEPA's findings in the Final Decision from a factual, technical and legal perspective. ERM notes that USEPA's findings and determinations in the Final Decision are the subject of pending litigation.

1.2 BACKGROUND

The Plant is a coal-fired generating station located in Cheshire, Gallia County, Ohio (Figure 1-1), and is bounded to the east by the Ohio River. The RWL and FAR are two of three CCR units at the Plant that are subject to regulation under the CCR Rule (the third unit is the Bottom Ash Pond [BAP] but that unit is not the focus of this report). The RWL is approximately 400 acres in size and is located about 1.25 miles northwest of the Plant (Figure 1-2). The CCR material disposed in the RWL is Flue Gas Desulfurization byproduct (consisting of scrubber cake, fly ash, and lime) and other approved materials (water treatment sludge, bottom ash, lime ball mill rejects, coal pulverizer rejects, and sand/moss from the vertical flow wetlands).

The FAR is approximately 300 acres in size and is located about 2.5 miles northwest of the Plant (Figure 1-2). From the mid-1970s until January 1995, fly ash was sluiced to the FAR and the settled CCR materials in the FAR were retained behind the Stingy Run Fly Ash Dam that formed the FAR. The FAR was closed in place, and the closure was completed in 2021. Closure was certified on July 30, 2021.

An updated combined groundwater monitoring system was certified in August 2021 to collectively monitor for potential releases from the RWL and FAR. Previously, Gavin maintained and monitored two separate (though adjacent) groundwater monitoring networks for the RWL and FAR, respectively. The combined monitoring network was certified on 31 August 2021 with completion of the Updated Groundwater Monitoring System Evaluation and Certification—40 CFR 257.91 (ERM 2021).

The combined network which monitors both the RWL (Figure 1-3) and FAR (Figure 1-4) currently includes 24 upgradient and 15 downgradient monitoring wells located in the Alluvium, Morgantown Sandstone, and Cow Run Sandstone. The upgradient wells are placed to accurately represent the quality of background groundwater that has not been affected by any potential leakage from the RWL and FAR units, while the downgradient wells in the network are positioned at the downgradient boundary of waste to detect potential release of CCR constituents from the CCR units into groundwater in the uppermost aquifer.

Consistent with the CCR Rule and with Gavin's Statistical Analysis Plan (ERM 2017), an interwell prediction limit approach was used to identify potential impacts to groundwater. Upper prediction limits were developed for the Appendix III parameters; in the case of pH, a lower prediction limit was also developed. Documentation of the development of the upper prediction limits and lower prediction limit is provided in the 2018 Alternate Source Demonstration for the RWL (ERM 2018b).

In 2022, six new monitoring wells were installed around the RWL and FAR to act as replacements for previously existing monitoring wells that were part of the certified monitoring network but that had to be removed as a result of a variety of factors, including landfill expansion activities. In addition, another eight new wells were installed in 2022 around the RWL and FAR to monitor groundwater in between existing monitoring well locations. Sampling is occurring at these wells, which are also being evaluated for addition to the monitoring network but have not yet been added to the certified network.

1.3 GEOLOGY AND HYDROGEOLOGY

The shallowest geologic materials at the FAR/RWL include mine spoil, fill, residual fine-grained soils, and weathered and fractured bedrock (ERM 2021a). Measured hydraulic conductivities for residual fine-grained soils range from 1.03×10^{-8} centimeters per second (cm/sec) to 5.60×10^{-9} cm/sec (AEP, 1993). The shallowest weathered and fractured bedrock present at the Site includes the Pomeroy Sandstone and Coal, the Pittsburgh Sandstone and Coal, the Bellaire Sandstone, and the Connellsville Sandstone units. Although some of these units may be partially or fully saturated in the vicinity of the FAR and RWL, these formations generally are not capable of yielding usable quantities of groundwater, and thus are not considered part of the uppermost aquifer at the FAR/RWL. In the vicinity of the Site, bedrock dips to the southeast at approximately 17 feet/mile (AEP 1993).

The Connellsville Sandstone is still present in portions of the ridges that surround the FAR valley and the RWL. However, the Connellsville Sandstone has been completely eroded in substantial

portions of the valley areas of the FAR, especially at the eastern extent of the FAR nearest the current extent of Stingy Run. The Connellsville Sandstone has also been partially or completely eroded in portions of the valley areas underlying the RWL.

Beneath the Connellsville Sandstone are the Clarksburg Red Beds, which is a regionally extensive aquitard (low-permeability rock layer) with a typical thickness of approximately 40 to 50 feet and average hydraulic conductivity values for the formation ranging from 2.1×10^{-7} cm/sec to 7.8×10^{-8} cm/sec (Geosyntec, 2012). The Clarksburg Red Beds hydraulically isolate the shallower bedrock formations from the underlying aquifers. The Clarksburg Red Beds have been observed to be partially or entirely eroded in portions of the valley areas of the FAR and RWL (Figures 1-5 and 1-6), especially in the eastern extent of the FAR valley areas. However, residual fine-grained soils generated in-situ by the weathering process are generally present in areas where erosion of the Clarksburg Red Beds has occurred. Based upon measured hydraulic conductivity values for the residual fine-grained soils (1.03×10^{-8} cm/sec to 5.60×10^{-9} cm/sec), these soils provide hydraulic separation similar to that provided by the Clarksburg Red Beds. Beneath the Clarksburg Red Beds are the Morgantown Sandstone and the Cow Run Sandstone. Together these units are interpreted as the uppermost aquifer beneath the RWL and FAR (Geosyntec 2016a; Geosyntec 2016b).

The Morgantown Sandstone is composed of two thin sandstone beds (upper and lower), which are separated by clay shale. The Morgantown Sandstone unit has a total average thickness of approximately 30 feet, and the upper and lower sandstone beds generally range in thickness from approximately three to seven feet. It has been documented through review of historical boring logs that the Morgantown Sandstone has been removed by erosion and is absent in portions of the Stingy Run and Kyger Creek valley areas. The Morgantown was also confirmed to be absent at recent boring 2022-06, which was advanced in 2022 in the Stingy Run valley at the northeastern end of the RWL (ERM 2024). Groundwater migrating east-southeast within the Morgantown Sandstone along the eastern portion of the RWL discharges to the alluvial aquifer located within the Stingy Creek and Kyger Creek valleys. Thus, the alluvial aquifer is also considered part of the uppermost aquifer where the Morgantown Sandstone is absent in these areas.

Below the Morgantown Sandstone is a unit of approximately 60 feet of interbedded claystone/clay shale and non-crystalline limestone layers, collectively known as the Round Knob Shale. These strata extend to the top of the underlying Cow Run Sandstone. Together, the residual fine-grained soils, the Clarksburg Red Beds, and the Round Knob Shale unit provide hydraulic separation from the aquifers underlying the RWL. Though the Clarksburg Red Beds have been partially or entirely eroded in portions of the FAR valley areas, the residual fine-grained soils and deeper Round Knob Shale unit provide hydraulic separation from the aquifers underlying the FAR similar to that provided by the collective lithologic units underlying the RWL.

Below the Round Knob Shale, the Cow Run Sandstone has an average thickness of 30 feet and is characterized regionally as a coarse-grained sandstone and sandy shale. The Cow Run Sandstone unit is continuous under the FAR/RWL and considered the base of the uppermost aquifer. Beneath the Cow Run Sandstone are the Portersville Limestone and the Anderson Clayshale which consist

primarily of shale, claystone, and clay shale (Geosyntec 2012). These low permeability formations are interpreted to be the lower hydraulic boundary of the uppermost aquifer.

1.3.1 GROUNDWATER FLOW

The removal of strip mine ponds, installation of groundwater intercept (GWI) drains, and placement of the composite liner under the RWL resulted in decreased recharge to the Morgantown Sandstone and Cow Run Sandstone. The changes during and post-construction were interpreted to result in the decline of potentiometric elevations up to 10 feet, which is similar to observed declines at another AEP residual waste landfill (AEP 1993).

At a regional scale, groundwater within the Morgantown Sandstone and Cow Run Sandstone generally flows from the northwest to the southeast under the FAR and the RWL toward the Ohio River, which is the primary regional discharge boundary for groundwater. At Site-scale, several factors influence groundwater flow directions in the area of the FAR/RWL, including topographic ridges and suppression of infiltration related to the FAR cap and the liner system of the RWL. Ridges along the western, eastern, and southern perimeters of the RWL constitute areas of recharge. Due to removal of strip mine ponds, installation of GWI drains, and placement of the composite liner, recharge to the center of the RWL has been cut off (AEP, 1993). Recent potentiometric surface maps, including those prepared for this report (Figures 1-7 and 1-8), incorporate not only the information from existing monitoring wells but also consider additional relevant data including original land surface topography, current land surface topography, landfill expansion, remaining recharge areas outside of the landfill expansion, and any effect of the GWIs.

1.3.1.1 GROUNDWATER FLOW ALONG THE WESTERN BOUNDARY OF THE RWL/FAR

To the west of the FAR/RWL, groundwater flows from west to east before joining the overall flow pattern to the southeast. The interpretation of west to east groundwater flow at the western boundary of the RWL is based on specific past and current observations along the western boundary. Groundwater flow maps prepared for the 1993 RWL Permit to Install (AEP, 1993; Figure No. 21) and the 1999 reissued Potentiometric Map of the RWL (AEP Drawing No. 3J of Drawing 12-30729-5) both interpreted groundwater flow from west to east in the Morgantown from a recharge area near wells 94131 toward the historical valley near Pond 1. The potentiometric contours in AEP Figure No. 21 and AEP Drawing No. 3J of Drawing 12-30729-5 also indicate a recharge area farther north, near wells 93102 and 94125, with components of groundwater flow to the southeast and east along the northwestern RWL boundary.

The 1960 USGS topographic map shows a topographic ridge existed east of Turkey Run Road, in the area that would become the western boundary of the RWL (USGS, 1960) The correlation of the potentiometric highs on the 1993 and 1999 figures referenced above and topographic highs suggests the area east of Turkey Run Road was a recharge area prior to the construction of the RWL. The USGS quadrangle notes the presence of historical mines in this area, which is interpreted to enhance recharge along ridges due to mine collapse and the presence of near-vertical fractures. While there has been some modification of the land surface in recent years

associated with the westward expansion of the RWL, the current land surface topography still consists of a ridge between the RWL and Turkey Run Road, as shown in Geologic Cross Section A-A' (Figure 1-5).

The RWL is located on the eastern side of this surface and groundwater ridge, so groundwater flow is interpreted to be from west to east at the western edge of the RWL, consistent with gravity-driven groundwater flow from areas of higher topographic relief to areas of lower topographic relief (Toth, 2009). This west to east flow pattern indicated in the 1993 interpretation is expected to be enhanced due to the reduction in recharge caused by removal of strip mine ponds that had acted as local recharge points within and near the RWL, installation of GWI drains which currently facilitate the movement of shallow groundwater to areas outside the RWL, and installation of the RWL liner which by design inhibits the downward migration of water (AEP, 1993).

Groundwater flow maps provided in the 2018 through 2023 Annual Groundwater Monitoring and Corrective Action Reports consistently show an easterly flow component in the Morgantown and Cow Run (ERM, 2019; ERM, 2020; ERM, 2021b; ERM, 2022; ERM, 2023; ERM, 2024). Justification for this interpretation based on potentiometric elevation data includes the following:

- The potentiometric surface at Morgantown well 2019-02 was higher than nearby Morgantown wells 2019-06 and 9535 in five out of six gauging events conducted between 2020 and 2022. The physical configuration of the wells and the measured piezometric elevations indicate an eastward groundwater flow direction in the Morgantown on the western side of the RWL.
- The potentiometric surface at Cow Run monitoring well 94126 was higher than nearby well 93100 in five out of six gauging events conducted between 2018 and 2019. The physical configuration of the wells and the measured piezometric elevations indicate an eastward groundwater flow direction in the Cow Run on the western side of the RWL.
- A comparison of potentiometric elevation data at wells 94125 and 2019-06 also supports the eastward flow interpretation. Well 94125 was abandoned in 2019 due to RWL expansion and replaced in 2020 by 2019-06, which was located 450 feet to the west, outside the new boundary of waste. The average potentiometric elevation at 94125 from 2013 to 2019 was 589.47 feet above sea level and the average elevation at 2019-06 from 2020 to 2023 is 601.79 feet above sea level. The 12.32-foot difference in average elevation over several years generally supports the interpretation of groundwater flow from west to east.

1.3.1.2 GROUNDWATER FLOW ALONG THE EASTERN BOUNDARY OF THE RWL/FAR

The interpretation of groundwater divides east of the RWL eastern waste boundary and within remnant highwalls (*e.g.*, near wells 94122, MW-15, and MW-16) is based on specific past and current observations along the eastern boundary, similar to those used to assess the groundwater divide along the western boundary of the RWL. The groundwater flow map prepared for the 1993

RWL PTI (AEP, 1993; Figure No. 21) interpreted radial groundwater flow in the Morgantown on the eastern side of the RWL from a recharge area near historic well 94122 and existing well 2001. This radial flow pattern is indicative of a recharge area and existed prior to the construction of the RWL.

The 1960 USGS topographic map shows a topographic ridge existed on the eastern boundary of the RWL at historic well 94122 and existing well 2000 (USGS, 1960). A ridge also ran northwest near the former FAR overflow spillway towards wells 2022-04 and 2022-05. Potentiometric highs were documented both on the eastern side of the future RWL near where the Stacker Pad currently exists, and north of where Pond 1 currently exists (AEP, 1993; Drawing No. 3J of Drawing 12-30729-5). The correlation of the potentiometric highs and topographic highs suggests that these areas were recharge areas prior to the construction of the RWL. The USGS quadrangle notes the presence of historical strip mines in this area, which may have enhanced recharge along ridges due to mine collapse and the presence of near-vertical fractures. While there has been some modification of the land surface in recent years associated with the expansion of the RWL, the current land surface topography still consists of a ridge along the eastern and northeastern sides of the RWL.

The groundwater divide prevents groundwater under the RWL from flowing towards the east in this area. West of the hydraulic divide located on the eastern side of the RWL, groundwater flow is interpreted to be from east to west before turning and flowing to the southeast. This east-to-west flow pattern was and is expected to be enhanced from 1993 interpretations due to the removal of strip mine ponds, installation of GWI drains, and placement of the composite liner that cut off recharge to the aquifer beneath the RWL (AEP, 1993).

1.3.1.3 REFINEMENT IN INTERPRETATION OF GROUNDWATER FLOW BENEATH THE RWL/FAR

In 2018, federal and state groundwater potentiometric elevation data sets for monitoring wells of the Morgantown and Cow Run were combined to increase spatial resolution and limit uncertainty in the interpretation of groundwater flow direction. This assessment identified: (i) the area of low hydraulic pressure along the axis of the landfill; (ii) groundwater flow from west to east on the western boundary; and (iii) a potentiometric high on the northeastern boundary of the RWL. The updated interpretation of regional groundwater flow in the Morgantown and Cow Run was from northwest to southeast towards the Ohio River. The overall interpretation of groundwater flow in the vicinity of the RWL/FAR is strongly influenced by site geology, pre-construction topography, and site preparation as hydraulic information is no longer able to be obtained from within the RWL due to the liner system or from within the FAR due to the cap.

Generally, the interpretations of groundwater flow under the RWL have been relatively consistent with overall flow towards the southeast. However, recent maps use higher-resolution datasets and differ in some ways from the flow directions and hydraulic features indicated in the 2012 PTI, such as the aforementioned ridge (Geosyntec, 2012). As shown in the 2018 through 2023 Annual GWMCA Reports, existing wells located along the eastern and northeastern boundary include couplet wells 2002 and 2003, and 2022-04 and 2022-05, located in the Morgantown and Cow

Run, respectively. At these locations, the Morgantown has a higher potentiometric surface than the Cow Run. These downward gradients demonstrate the presence of recharge areas. Groundwater flow direction maps prepared for the 2018-2023 Annual GWMCA Reports consistently show groundwater mounds and radial flow in the Morgantown in this area.

1.4 2024 H2 GROUNDWATER SAMPLING EVENT

The data from the second semiannual groundwater sampling event from 2024 were compared to the upper and lower prediction limits for the Appendix III parameters, and SSIs for Appendix III analytes were identified in one well. Tables 1-1 and 1-2 summarize occurrences of SSIs from the H2 2024 sampling event.

[1] Well 2018-01 was abandoned in 2022. A replacement monitoring well is currently being evaluated.

This ASD Report identifies the regional discharge of naturally occurring brine originating from bedrock as the source of calcium, chloride, and total dissolved solids (TDS) detected in groundwater collected from monitoring well 9631. Supporting information and additional discussion of the lines of evidence are presented in subsequent sections of this ASD Report.

2. DESCRIPTION OF ALTERNATE SOURCES

Regional Brine is identified as the alternate source for the calcium, chloride, and TDS that are observed at the RWL/FAR. This a due to naturally occurring brine originating in/from bedrock (i.e., Cow Run Sandstone) as observed in shallow groundwater in and around Gavin.

A summary of regional brine and its influence on groundwater quality is provided below.

2.1 REGIONAL BRINE

Naturally occurring brine, which is known in the Ohio River Valley to have elevated levels of calcium, chloride, and other trace elements, exists in the subsurface (Stout et al. 1932; ORSANCO 1984; ODNR 1995). The discharge of brines is seen at a regional scale, with shallow wells near the Ohio River observing brine impacts because of the vertical head gradient driving overall flow upwards from bedrock to alluvium (USGS 1997). The Cow Run Sandstone is the shallowest sandstone of any importance in Ohio where brine of marine origin has been observed (Phalen 1919; Stout et al. 1932). Brine was discovered at the land surface approximately 10 miles southwest of the Plant in Gallipolis, Ohio and was utilized for the commercial production of salt beginning in 1807. This commercial production was enhanced by advancing a boring to a depth of 100 feet below ground surface, which resulted in a brine much stronger than found at the land surface (Stout et al. 1932). Naturally occurring brine was also identified at the land surface in Jackson, Ohio approximately 30 miles west of the Plant (ODNR 1995). The regional presence of shallow brine indicates the potential for naturally occurring brine to contribute Appendix III constituents in groundwater at the Plant. Evidence of brine impacts near the Plant includes specific conductivity measurements at several Cow Run Sandstone monitoring wells upgradient of the RWL and FAR (2016-10, 2019-07, 2019-09) that are consistently greater than 30,000 µS/cm and reach as high as 50,062 µS/cm at monitoring well 2019-07. For reference, the approximate specific conductivity of seawater is 50,000 µS/cm (USGS 2019). The same upgradient wells have historically contained elevated levels of constituents like calcium and chloride which range as high as 1,200 mg/L and 23,000 mg/L, respectively.

Site specific evidence on the presence of brine and the constituents present within brine is discussed in Section 4.

3. HYDRAULIC CONNECTIONS TO THE ALTERNATE SOURCES

Explanations of the hydraulic connections between potential alternate sources and downgradient wells at the RWL/FAR were provided in the first ASD Reports for the FAR and RWL (ERM 2018a, ERM 2018b) and are summarized below. Groundwater potentiometric contour maps for the Morgantown and Cow Run Sandstone are depicted in Figures 1-7 and 1-8, respectively.

3.1 HYDRAULIC CONNECTION TO REGIONAL BRINE

Regional groundwater within the fractured sedimentary bedrock in the Ohio River Valley generally flows from areas of higher topographic elevation towards areas of lower elevation, ultimately discharging to the Ohio River (ORSANCO 1984). Precipitation infiltrates the land surface to recharge the underlying aquifers below, and the flow of groundwater within these aquifers is primarily driven by the gravitational force on groundwater (differences in hydraulic head) within the bedrock. The Cow Run Sandstone extends west of the RWL/FAR where naturally occurring brine (with elevated calcium, chloride, and TDS) is known to impact Cow Run groundwater (Phalen 1919, Stout et. al. 1932). As depicted in Figures 1-7 and 1-8, the Morgantown and Cow Run under the southeastern portion of the FAR and under the RWL contain a region of lower hydraulic pressure in comparison to the surrounding areas. The forested and pastured areas surrounding the FAR and RWL are more permeable and exhibit greater infiltration than the FAR and RWL, which have either an engineered cap (FAR) or liner (RWL) designed to reduce or eliminate recharge to the underlying aquifers. Thus the pathway for regional groundwater flows through the fractured bedrock from regions surrounding the RWL/FAR to regions of lower pressure south and east of the RWL and eventually toward the Ohio River. As described in Section 2, Cow Run monitoring wells 2016-10, 2019-07, and 2019-09, which are hydraulically upgradient of the RWL and FAR exhibit elevated specific conductivity measurements, consistent with regional observations of brine. Based on these considerations, the fractured rock of the sandstones is hydraulically connected to brine, which is the alternate source of calcium, chloride, and TDS.

3.1.1 GROUNDWATER FLOW RATES

Packer tests were completed in 2012 to assess hydraulic conductivity for locations in both the Morgantown and Cow Run Sandstone around the northern portion of the RWL (AEP and Geosyntec 2012). The range of hydraulic conductivity values from the packer tests in the Morgantown and Cow Run are provided in Table 3-1.

TABLE 3-1: ESTIMATED HYDRAULIC CONDUCTIVITY VALUES FOR MORGANTOWN AND COW RUN SANDSTONE

	Average K	Low K	High K
Morgantown (Geosyntec 2012)	7.18 x 10^{-5} cm/sec	2.2 x 10^{-8} cm/sec	4.6 x 10^{-4} cm/sec
Cow Run (Geosyntec 2012)	2.92 x 10^{-5} cm/sec	5.0 x 10^{-8} cm/sec	5.9 x 10^{-4} cm/sec

Notes: cm/sec = centimeters per second; K = hydraulic conductivity
Geosyntec 2012 values derived from packer tests (10-foot interval) completed in boreholes across mainly the northern part of the RWL.

The velocity of groundwater flowing through the Morgantown Sandstone was estimated in 2024 based on the measured horizontal hydraulic gradient (0.010 feet/feet), estimated hydraulic conductivity of 7.18 x 10^{-5} cm/sec (AEP and Geosyntec 2012), and an estimated effective porosity value of 0.01 for fractured bedrock. The estimated groundwater velocity calculated is approximately 77 to 79 feet/year (ERM 2025).

The velocity of groundwater flowing through the Cow Run Sandstone was estimated for 2024 based on the measured horizontal hydraulic gradient (0.010 feet/feet), the estimated hydraulic conductivity of 2.92 x 10^{-5} cm/sec (AEP and Geosyntec 2012), and an effective porosity value of 0.01 for fractured bedrock. The estimated groundwater velocity calculated is approximately 31 to 32 feet/year (ERM 2025).

Fractures observed at the site vary in frequency, distribution, and orientation as seen by the variability in monitoring well recharge rates and the measured hydraulic conductivity (Table 3-1). Groundwater flow is expected to occur primarily through the fractures, as the porosity of the fractures is expected to be much greater than the porosity of the rock matrix. Mine-roof collapse in underground mines commonly causes the overlying rocks to settle and fracture (AEP 1993). This settling may cause subsidence and the vertical propagation of extensive fractures to the land surface. Vertical seepage can also occur to lower aquifers along these steeply inclined stress relief fractures (AEP 1993). As such, areas of the Site that were previously mined, including the ridges surrounding the RWL and FAR, are expected to act as recharge areas.

4. CONSTITUENTS ARE PRESENT AT THE ALTERNATE SOURCES OR ALONG THE FLOW PATHWAYS

Regional brine is identified as the source of calcium, chloride, and TDS in RWL/FAR downgradient groundwater. Groundwater quality at the RWL/FAR is also influenced by external sources, as described in Sections 2, 3, and 7.

4.1 REGIONAL BRINE

Regional brine, as discussed above, is present in the area of the Plant and locally in bedrock under the RWL/FAR. Federal monitoring wells 2019-07 and 2019-09, which were installed upgradient of the RWL in Cow Run Sandstone, have chemical signatures indicating brine. In addition to the brine signatures observed in upgradient RWL wells, brine signatures have also been detected in Cow Run wells located at the BAP. At the BAP, concentrations of calcium, chloride, fluoride, and TDS are generally higher, and in some cases one to two orders of magnitude higher in bedrock than in the overlying alluvial aquifer, consistent with a regional brine signature. The ranges for calcium, chloride, and TDS in upgradient Morgantown groundwater (2019-02 and 2019-06), upgradient Cow Run groundwater (2019-07 and 2019-09), and brine-impacted wells located at the BAP (BAC-09, BAC-11, BAC-13, BAC-19) are presented in Table 4-1.

TABLE 4-1 CONCENTRATIONS IN ON-SITE BRINE IMPACTED BEDROCK GROUNDWATER

Analyte	Units	Upgradient Morgantown Groundwater at the RWL	Upgradient Cow Run Groundwater at the RWL	Bedrock Groundwater at the BAP
Calcium	mg/L	27-310	1,200	100-2,900
Chloride	mg/L	110-12,000	22,000-23,000	1,000-25,000
TDS	mg/L	1,300-14,000	29,000-31,000	1,300-35,000

Notes: BAP = Bottom Ash Pond; mg/L = milligrams per liter; RWL = Residual Waste Landfill; TDS = total dissolved solids
Upgradient Morgantown Groundwater at the RWL includes data from monitoring wells 2019-02 and 2019-06 and represents a range of values obtained from September 2020 to February 2024.
Upgradient Cow Run Groundwater at the RWL includes data from monitoring wells 2019-07 and 2019-09 samples collected in September 2024.
Bedrock Groundwater at the BAP includes data from monitoring wells BAC-09, BAC-11, BAC-13, BAC-19 samples collected in October 2024.

Based on a review of permit applications for historical oil and gas wells installed within the Gavin property by prior owners, the Ohio Department of Natural Resources (ODNR) routinely required applicants to identify the company responsible for collecting, transporting, and disposing of salt water to be produced by the proposed well. Oil and gas wells in the vicinity of the Gavin plant were typically drilled to a depth of approximately 1,800 feet below ground surface and recovered brine was temporarily stored in pits at the wellsite prior to offsite disposal. In addition, the

permits demonstrate that the boreholes were typically not sealed below 250 feet below ground surface if oil and gas were not found, which would leave an unsealed borehole that could allow the upward migration of brine to shallower strata, including the Cow Run. These ODNR records demonstrate the naturally occurring presence of brine at the Gavin property in geologic strata located beneath the Cow Run Sandstone and the potential for upward migration of brine through unsealed boreholes (ODNR 2024).

The elevated concentrations of calcium, chloride, and TDS in the upgradient bedrock groundwater indicate that these constituents are present in brine at the regional level and along flow paths to Cow Run wells at the Gavin Plant.

5. LINKAGES OF CONSTITUENT CONCENTRATIONS AND DISTRIBUTIONS BETWEEN ALTERNATE SOURCES AND DOWNGRADIENT WELLS

5.1 REGIONAL BRINE

As discussed in Sections 2 and 4, the concentrations of calcium, chloride, and TDS are elevated in regional brine. Table 4-1 demonstrates that the concentration of calcium, chloride, and TDS are higher in Cow Run groundwater upgradient of the RWL than in Morgantown groundwater in the area. This is indicative of a source emanating from a deeper stratum (e.g. where brine is found). As demonstrated in Section 4, oil & gas well permits indicate that brine is present in sandstone strata under the RWL/FAR.

Regionally, concentrations of calcium exceeding 10,000 mg/L, chloride exceeding 50,000 mg/L, and TDS exceeding 100,000 mg/L have been observed in Ohio brines (Stout et. al. 1932). Locally, the concentrations of calcium, chloride, and TDS observed in groundwater from monitoring well 9631 are consistent with upgradient wells impacted by regional brine, as summarized in Table 5-1. As described in Section 3, the pathway for regional groundwater follows hydraulic pressure gradients through the fractured Cow Run Sandstone from regions located north, west and southwest of the RWL/FAR, to the southern and eastern regions toward the Ohio River. As described in Section, 3.1.1, hydraulic conductivity of the underlying bedrock varies at the site, resulting in brine impacts being localized to individual zones. Thus, there is a well-documented regional source of brine, brine impacts are detected at upgradient wells at the Site, hydraulic pathways exist from deeper to shallower strata and the similarity of the calcium, chloride, and TDS concentrations between monitoring well 9631 and upgradient well 2019-07 demonstrate the linkage of constituent concentrations between the alternate source (brine) and downgradient wells.

TABLE 5-1: COMPARISON OF BRINE IMPACTED BEDROCK TO DOWNGRADIENT WELL 9631

Analyte	Units	Maximum Brine-Impacted Groundwater in Upgradient Bedrock RWL/FAR (As measured at 2019-07)	Monitoring Well 9631
Calcium	mg/L	1,200	1,400
Chloride	mg/L	23,000	29,000
TDS	mg/L	31,000	41,000

Notes: RWL/FAR = Residual Waste Landfill/Fly Ash Reservoir; mg/L = milligrams per liter
Results from groundwater samples collected in September 2024

6. DATA DOES NOT INDICATE THAT THE RWL/FAR IS THE SOURCE

6.1 GEOCHEMICAL SIGNATURES

The geochemical fingerprints of landfill leachate from the RWL and downgradient well 9631 were evaluated using the concentrations of Appendix III parameters. Landfill leachate is characterized by elevated concentrations of boron, chloride, and sulfate – concentrations of these parameters in groundwater from well 9631 and leachate from Ponds 1 and 2 are shown in Figure 6-1. These parameters were selected due to their elevated concentrations in site landfill leachate, their elevated solubility in water, limited potential for sorption, and limited potential for transformations due to changes in redox conditions.

The samples presented in these time series plots were collected from 2010 through 2024. The primary observations based on these plots are the following.

- Sulfate is consistently one-to-two orders of magnitude higher in landfill leachate than in groundwater from monitoring well 9631. The increasing concentrations of calcium, chloride, and TDS in groundwater from well 9631 were not accompanied by an increase in sulfate concentrations. Given the elevated concentrations of sulfate in landfill leachate, a release from the landfill could not occur without a concurrent increase in the concentration of sulfate in downgradient wells.
- In contrast, chloride has been consistently higher at monitoring well 9631 than in landfill leachate. Monitoring well 9631 was not sampled in 2022 or 2023 due to malfunctions with the pump. After a new pump was installed in December 2023, samples were collected in February and March of 2024. Chloride concentrations increased sharply compared to data collected in 2021 or earlier. A release of landfill leachate and subsequent mixing with groundwater would result in a decrease in the concentration of chloride in groundwater from monitoring well 9631, which did not occur.
- Boron is consistently an order of magnitude higher in landfill leachate than in groundwater collected from monitoring well 9631. The increasing concentrations of calcium, chloride, and TDS in groundwater from well 9631 were not accompanied by an increase in boron concentrations. Boron is expected to act as a conservative tracer due to its high solubility and mobility in water. Therefore, a release of landfill leachate would result in an increase in boron concentrations, which was not observed from 2010 through spring 2024.

A release from the RWL/FAR would result in increasing concentrations of boron and sulfate and decreasing concentrations of chloride at monitoring well 9631. In contrast, chloride has increased since 2021 while boron and sulfate have remained stable. Further, a release from the RWL/FAR would need to migrate from the surface through the Morgantown Sandstone before concentrations would increase in the Cow Run Sandstone. SSIs were not detected in any downgradient wells screened in the Morgantown Sandstone.

Based on the data summarized above and the chemical signatures of the groundwater at issue, the RWL/FAR is not deemed to be the source of the SSIs.

7. ALTERNATE SOURCE DATA ARE HISTORICALLY CONSISTENT WITH HYDROGEOLOGIC CONDITIONS AND FINDINGS OF THE MONITORING PROGRAM

7.1 REGIONAL BRINE

The existence of Regional Brine in the area surrounding the plant is supported by historical studies and data. Regional groundwater flow regimes through fractured bedrock upgradient of the RWL/FAR were established after the last deglaciation, which occurred approximately 14,000 years ago (Hansen 2017). Enhancement of transmissivity in Ohio River Valley from stress-relief fracturing in bedrock provides conditions for bedrock to be interconnected to coarse glacial outwash alluvial deposits (USGS 1981; USGS 1997). Regional groundwater within the fractured sedimentary bedrock in the Ohio River Valley generally flows from areas of higher topographic elevation towards areas of lower elevation, ultimately discharging to the Ohio River (ORSANCO 1984). Assuming a conservatively high effective porosity of 1 percent, estimated groundwater velocity values for the Morgantown Sandstone and Cow Run Sandstone units are approximately 77 to 79 feet per year and 31 to 32 feet per year, respectively. These flow rates would allow ample time for groundwater to migrate from upgradient regional background sources to Plant property. The data supporting these conclusions are historically consistent with hydrogeologic conditions and findings of the RWL/FAR monitoring program.

The discharge of brines is seen at a regional scale along the Ohio River with shallow wells near the Ohio River observing saltwater impacts; whereas, further from the Ohio River shallow wells report little to no brine impacts (USGS 1997). TDS concentrations observed in bedrock wells around the RWL/FAR are consistent with observations seen at brine-freshwater mixing zones at other brine-impacted sites (Yager et al. 2017). The regional and site-specific data are in strong agreement, therefore, and lead to the conclusion that regional brines are discharging under the RWL/FAR and mixing with Cow Run groundwater underneath the RWL/FAR.

8. CONCLUSIONS

The SSIs identified in this ASD Report are based on results from downgradient RWL/FAR monitoring well samples collected in September/October 2024. Review of data for quality assurance and statistical comparison was completed on December 16, 2024. In response to the SSIs, this ASD Report was prepared within the required 90-day period in accordance with 40 CFR § 257.94(e)(2).

SSIs in the downgradient RWL/FAR monitoring well 9631 have been determined to result from alternate sources based on analysis of the gathered data: discharge of regional brine present in bedrock. Table 8-1 summarizes the six lines of evidence for each of the SSIs.

In conclusion, the RWL/FAR is not the source of the SSIs associated with the second semiannual sampling event groundwater results for 2024. Thus, Gavin will continue detection monitoring at the RWL/FAR in accordance with 40 CFR § 257.94(e)(2).

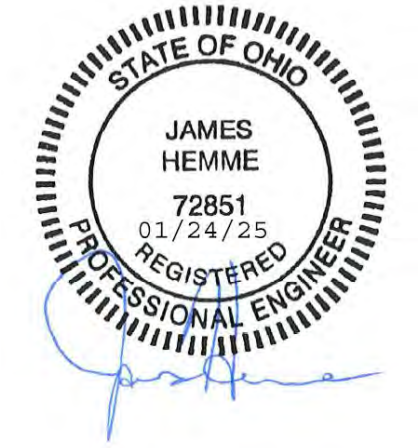

TABLE 8-1: RWL/FAR ASD SUMMARY

Analyte	SSI Location	Six Lines of Evidence from USEPA Guidance					
		Alternate Source	Hydraulic Connection	Constituent Present at Source or along Flow Path	Constituent Distribution More Strongly Linked to Alternate Source	Constituent Could Not Have Resulted from the RWL/FAR	Data Are Historically Consistent with Hydrogeologic Conditions
Calcium	9631	Regional Brine	X	X	X	X	X
Chloride	9631	Regional Brine	X	X	X	X	X
TDS	9631	Regional Brine	X	X	X	X	X

Notes: RWL/FAR = Residual Waste Landfill/Fly Ash Reservoir; SSI = statistically significant increase; USEPA = United States Environmental Protection Agency.

9. PROFESSIONAL ENGINEER CERTIFICATION

I hereby certify that I, or an agent under my review, have prepared this Alternate Source Demonstration Report for the Residual Waste Landfill/Fly Ash Reservoir and it meets the requirements of 40 CFR § 257.94(e)(2). To the best of my knowledge, the information contained in this Report is true, complete, and accurate.

James A. Hemme, P.E.

Notes:
FD = Field duplicate sample
N = Normal environmental sample
deg C = Degree Celcius
mg/L = Milligrams per liter
mV = Milivolts
NTU = Nephelometric Turbidity Unit
uS/cm = Microsiemens per centimeter
pCi/L = Picocuries per liter
B: Compound was found in the blank and sample.
J: Result is less than the reporting limit but greater than or equal to the method detection limit and the concentration is an approximate value.

U: Indicates the analyte was analyzed for but not detected.
Empty cells = Not analyzed

Notes:
FD = Field duplicate sample
N = Normal environmental sample
deg C = Degree Celcius
mg/L = Milligrams per liter
mV = Milivolts
NTU = Nephelometric Turbidity Unit
uS/cm = Microsiemens per centimeter
pCi/L = Picocuries per liter
B: Compound was found in the blank and sample.
J: Result is less than the reporting limit but greater than or equal to the method detection limit and the concentration is an approximate value.

U: Indicates the analyte was analyzed for but not detected.
Empty cells = Not analyzed

Zinc	mg/L				0.4 U												0.015 J

Notes:
FD = Field duplicate sample
N = Normal environmental sample
deg C = Degree Celcius
mg/L = Milligrams per liter
mV = Milivolts
NTU = Nephelometric Turbidity Unit
uS/cm = Microsiemens per centimeter
pCi/L = Picocuries per liter
B: Compound was found in the blank and sample.
J: Result is less than the reporting limit but greater than or equal to the method detection limit and the concentration is an approximate value.

U: Indicates the analyte was analyzed for but not detected.
Empty cells = Not analyzed

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing North Central, LLC Project Manager.

Qualifiers

Metals

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

General Chemistry

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Job ID: 240-199891-1 Eurofins Cleveland

Job Narrative
240-199891-1

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers are applied to indicate exceptions. Noncompliant quality control (QC) is further explained in narrative comments.

- Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
- Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt
The sample was received on 2/23/2024 8:00 AM. Unless otherwise noted below, the sample arrived in good condition, and, where required, properly preserved and on ice. The temperature of the cooler at receipt time was 1.7°C.

Metals
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry
Method 300.0_28D: The following sample was diluted due to the nature of the sample matrix: 2019-06-F-A34C-20240222-01 (240-199891-1). Elevated reporting limits (RLs) are provided.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing North Central, LLC Project Manager.

Client: Lightstone Generation Gavin Power LLC
Job ID: 240-199892-1
Project/Site: Federal CCR Wells - App IV - Snap Sampler

Qualifiers

Metals

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Job ID: 240-199892-1 Eurofins Cleveland

Job Narrative
240-199892-1

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers are applied to indicate exceptions. Noncompliant quality control (QC) is further explained in narrative comments.

- Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
- Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt
The sample was received on 2/23/2024 8:00 AM. Unless otherwise noted below, the sample arrived in good condition, and, where required, properly preserved and on ice. The temperature of the cooler at receipt time was 1.7°C.

Metals
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing North Central, LLC Project Manager.

Qualifiers

Metals

Qualifier	Qualifier Description
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
B	Compound was found in the blank and sample.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Rad

Qualifier	Qualifier Description
F1	MS and/or MSD recovery exceeds control limits.
U	Result is less than the sample detection limit.
X	Carrier is outside acceptance limits.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Job ID: 240-199893-1 Eurofins Cleveland

Job Narrative
240-199893-1

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers are applied to indicate exceptions. Noncompliant quality control (QC) is further explained in narrative comments.

- Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
- Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt
The samples were received on 2/23/2024 8:00 AM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperatures of the 2 coolers at receipt time were 1.1°C and 1.6°C.

Metals
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry
Method 300.0_28D: The following samples were diluted due to the nature of the sample matrix: 9631-F-A4-20240221-01 (240-199893-1) and DUP-001-F-A4-20240221-01 (240-199893-2). Elevated reporting limits (RLs) are provided.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Gas Flow Proportional Counter
Method 9315_Ra226: Radium 226 prep batch 160-650190

The barium carrier recovery is outside the upper control limit (110%) for the following samples: 9631-F-A4-20240221-01 (240-199893-1), 9631-F-A4-20240221-01 (240-199893-1[MS]), 9631-F-A4-20240221-01 (240-199893-1[MSD]) and DUP-001-F-A4-20240221-01 (240-199893-2). There was physical evidence of matrix interference apparent during the initial preparation of the sample. The QC samples associated with the batch have acceptable carrier recovery indicating the presence of matrix interference.

Method 9315_Ra226: Radium-226 prep batch 160-650190:

The matrix spike / matrix spike duplicate (MS/MSD) recoveries for preparation batch 160-650190 and analytical batch 160-653889 were outside control limits for one or more analytes. See QC Sample Results for detail. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery is within acceptance limits. 9631-F-A4-20240221-01 (240-199893-1[MS]) and 9631-F-A4-20240221-01 (240-199893-1[MSD])

Method 9315_Ra226: Radium-226 prep batch 160-650190:

The following sample has a barium carrier recovery above the 110% QC limit. Affected samples had a barium correction applied, however, there is significant concentrations of salt-like compounds (i.e. calcium, magnesium, sodium, and strontium) that can interfere with a barium sulfate recovery. The LCS (laboratory control sample) has an acceptable spike recovery demonstrating acceptable sample preparation and instrument performance. The samples have been truncated to 100% to reduce any potential bias a high carrier recovery may have. The data have been qualified and reported. 9631-F-A4-20240221-01 (240-199893-1), 9631-F-A4-20240221-01 (240-199893-1[MS]), 9631-F-A4-20240221-01 (240-199893-1[MSD]) and DUP-001-F-A4-20240221-01 (240-199893-2)

Method 9320_Ra228: Radium 228 prep batch 160-650192

The barium carrier recovery is outside the upper control limit (110%) for the following samples: 9631-F-A4-20240221-01 (240-199893-1), 9631-F-A4-20240221-01 (240-199893-1[MS]), 9631-F-A4-20240221-01 (240-199893-1[MSD]) and DUP-001-F-A4-20240221-01 (240-199893-2). There was physical evidence of matrix interference apparent during the initial preparation of the sample. The QC samples associated with the batch have acceptable carrier recovery indicating the presence of matrix

interference.

Method 9320_Ra228: Radium-228 prep batch 160-650192:

The matrix spike / matrix spike duplicate (MS/MSD) recoveries for preparation batch 160-650192 and analytical batch 160-653894 were outside control limits for one or more analytes. See QC Sample Results for detail. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery is within acceptance limits.

Method 9320_Ra228: Radium-228 prep batch 160-650192:

The following sample has a barium carrier recovery above the 110% QC limit. Affected samples had a barium correction applied, however, there is significant concentrations of salt-like compounds (i.e. calcium, magnesium, sodium, and strontium) that can interfere with a barium sulfate recovery. The LCS (laboratory control sample) has an acceptable spike recovery demonstrating acceptable sample preparation and instrument performance. The samples have been truncated to 100% to reduce any potential bias a high carrier recovery may have. The data have been qualified and reported. 9631-F-A4-20240221-01 (240-199893-1), 9631-F-A4-20240221-01 (240-199893-1[MS]), 9631-F-A4-20240221-01 (240-199893-1[MSD]) and DUP-001-F-A4-20240221-01 (240-199893-2)

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Rad
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Note: Since laboratory accreditations are subject to change, Eurofins Environment Testing North Central, LLC places the ownership of method, analyte & accreditation compliance upon our subcontract laboratories. This sample shipment is forwarded under chain-of-custody. If the laboratory does not currently maintain accreditation in the State of Origin listed above for analysis/tests/matrix being analyzed, the samples must be shipped back to the Eurofins Environment Testing North Central, LLC laboratory or other instructions will be provided. Any changes to accreditation status should be brought to Eurofins Environment Testing North Central, LLC attention immediately. If all requested accreditations are current to date, return the signed Chain of Custody attesting to said compliance to Eurofins Environment Testing North Central, LLC.

Possible Hazard Identification	*Sample Disposal (A fee may be assessed if samples are retained longer than 1 month)*

Job Number: 240-199893-1

Login Number: 199893
List Number: 2
Creator: Pinette, Meadow L

List Source: Eurofins St. Louis
List Creation: 02/26/24 03:43 PM

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	True	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	N/A	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	N/A	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing North Central, LLC Project Manager.

Authorization

Qualifiers

Metals

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Job ID: 240-199895-1 Eurofins Cleveland

Job Narrative
240-199895-1

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers are applied to indicate exceptions. Noncompliant quality control (QC) is further explained in narrative comments.

- Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
- Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt
The sample was received on 2/23/2024 8:00 AM. Unless otherwise noted below, the sample arrived in good condition, and, where required, properly preserved and on ice. The temperatures of the 2 coolers at receipt time were 1.1°C and 1.6°C.

Metals
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Method Summary

Client: Lightstone Generation Gavin Power LLC
Job ID: 240-199895-1
Project/Site: Federal CCR Wells - App III & IV Combined

Method	Method Description	Protocol	Laboratory
6010D	Metals (ICP)	SW846	EET CLE
6020B	Metals (ICP/MS)	SW846	EET CLE
7470A	Mercury (CVAA)	SW846	EET CLE
300.0	Anions, Ion Chromatography	EPA	EET CLE
3005A	Preparation, Total Recoverable or Dissolved Metals	SW846	EET CLE
7470A	Preparation, Mercury	SW846	EET CLE

JOB DESCRIPTION

Federal CCR Wells - App III

JOB NUMBER

240-199896-1

Eurofins Cleveland
180 S. Van Buren Avenue
Barberton OH 44203

See page two for job notes and contact information.

myEOL

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing North Central, LLC Project Manager.

Authorization

Roxanne Cisneros

Qualifiers

Metals

Qualifier	Qualifier Description
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

General Chemistry

Qualifier	Qualifier Description
F2	MS/MSD RPD exceeds control limits
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Job ID: 240-199896-1 Eurofins Cleveland

Job Narrative
240-199896-1

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers are applied to indicate exceptions. Noncompliant quality control (QC) is further explained in narrative comments.

- Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
- Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt
The samples were received on 2/23/2024 8:00 AM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperatures of the 2 coolers at receipt time were 1.1°C and 1.6°C.

Metals
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry
Method 300.0_28D: An incorrect volume of spiking solution was inadvertently added to the matrix spike duplicate (MSD) associated with analytical batch 240-604990. Percent recoveries are based on the amount spiked.

Method 300.0_28D: The following samples were diluted due to the nature of the sample matrix: 9631-F-A3-20240221-01 (240-199896-1), DUP-001-F-A3-20240221-01 (240-199896-2) and EB-001-F-A3-20240221-01 (240-199896-3). Elevated reporting limits (RLs) are provided.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Method Summary

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing North Central, LLC Project Manager.

Qualifiers

Metals

Qualifier	Qualifier Description
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Rad

Qualifier	Qualifier Description
G	The Sample MDC is greater than the requested RL.
U	Result is less than the sample detection limit.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Job ID: 240-200758-1 — Eurofins Cleveland

Job Narrative
240-200758-1

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers are applied to indicate exceptions. Noncompliant quality control (QC) is further explained in narrative comments.

- Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
- Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt
The samples were received on 3/7/2024 8:00 AM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperature of the cooler at receipt time was 3.8°C.

Metals
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Gas Flow Proportional Counter
Method 9320_Ra228: Radium-228 prep batch 160-652064:

The detection goal was not met for the following sample due to the reduced sample volume attributed to the presence of matrix interferences: 96154R-F-20240306-01 (240-200758-1) . Analytical results are reported with the detection limit achieved.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Rad
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

IR GUN # 22 (CF 0.0 °C) Observed Cooler Temp 3.8 °C Corrected Cooler Temp 3.8 °C

2.	Were tamper/custody seals on the outside of the cooler(s)? If Yes Quantity 1	Yes No
	-Were the seals on the outside of the cooler(s) signed & dated?	Yes No NA
	-Were tamper/custody seals on the bottle(s) or bottle kits (LLHg/MeHg)?	Yes No
	-Were tamper/custody seals intact and uncompromised?	Yes No NA
3	*Shippers' packing slip attached to the cooler(s)?*	Yes No
4	Did custody papers accompany the sample(s)?	Yes No
5	Were the custody papers relinquished & signed in the appropriate place?	Yes No
6	Was/were the person(s) who collected the samples clearly identified on the COC?	Yes No
7	Did all bottles arrive in good condition (Unbroken)?	Yes No
8	Could all bottle labels (ID/Date/Time) be reconciled with the COC?	Yes No
9	For each sample, does the COC specify preservatives (Y/N), # of containers (Y/N), and sample type of grab/comp (Y/N)?	
10	Were correct bottle(s) used for the test(s) indicated?	Yes No
11	Sufficient quantity received to perform indicated analyses?	Yes No
12.	Are these work share samples and all listed on the COC?	Yes No
	If yes, Questions 13-17 have been checked at the originating laboratory	
13	*Were all preserved sample(s) at the correct pH upon receipt?*	Yes No NA pH Strip Lot# ~~HC316719~~ HC329089
14	Were VOAs on the COC?	Yes No
15	Were air bubbles >6 mm in any VOA vials? ● ⬅ Larger than this	Yes No NA
16	Was a VOA trip blank present in the cooler(s)? Trip Blank Lot #	Yes No
17	Was a LL Hg or Me Hg trip blank present?	Yes No

Tests that are not checked for pH by Receiving.

Note: Since laboratory accreditations are subject to change, Eurofins Environment Testing North Central, LLC places the ownership of method, analyte & accreditation compliance upon our subcontract laboratories. This sample shipment is forwarded under chain-of-custody. If the laboratory does not currently maintain accreditation in the State of Origin listed above for analysis/tests/matrix being analyzed, the samples must be shipped back to the Eurofins Environment Testing North Central, LLC laboratory or other instructions will be provided. Any changes to accreditation status should be brought to Eurofins Environment Testing North Central, LLC attention immediately. If all requested accreditations are current to date, return the signed Chain of Custody attesting to said compliance to Eurofins Environment Testing North Central, LLC.

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	True	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	N/A	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	N/A	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	N/A	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing North Central, LLC Project Manager.

Project/Site: Federal CCR Wells

Job ID: 240-200982-1

Qualifiers

Metals

Qualifier	Qualifier Description
B	Compound was found in the blank and sample.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Rad

Qualifier	Qualifier Description
G	The Sample MDC is greater than the requested RL.
U	Result is less than the sample detection limit.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Job ID: 240-200982-1 Eurofins Cleveland

Job Narrative
240-200982-1

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers are applied to indicate exceptions. Noncompliant quality control (QC) is further explained in narrative comments.

- Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
- Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt
The sample was received on 3/13/2024 8:00 AM. Unless otherwise noted below, the sample arrived in good condition, and, where required, properly preserved and on ice. The temperatures of the 3 coolers at receipt time were 1.4°C, 1.9°C and 2.8°C.

Metals
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Gas Flow Proportional Counter
Method 9320_Ra228: Radium-228 prep batch 160-652686:

The detection goal was not met for the following sample due to the reduced sample volume attributed to the presence of matrix interferences: 2016-07-F-20240307-01 (240-200982-1) . Analytical results are reported with the detection limit achieved.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Rad
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Note: Since laboratory accreditations are subject to change, Eurofins Environment Testing North Central, LLC places the ownership of method, analyte & accreditation compliance upon our subcontract laboratories. This sample shipment is forwarded under chain-of-custody. If the laboratory does not currently maintain accreditation in the State of Origin listed above for analysis/tests/matrix being analyzed, the samples must be shipped back to the Eurofins Environment Testing North Central, LLC laboratory or other instructions will be provided. Any changes to accreditation status should be brought to Eurofins Environment Testing North Central, LLC attention immediately. If all requested accreditations are current to date, return the signed Chain of Custody attesting to said compliance to Eurofins Environment Testing North Central, LLC.

Project/Site: Federal CCR Wells

Qualifiers

Metals

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

General Chemistry

Qualifier	Qualifier Description
E	Result exceeded calibration range.

Rad

Qualifier	Qualifier Description
U	Result is less than the sample detection limit.
X	Carrier is outside acceptance limits.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Job Narrative
240-200984-1

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers are applied to indicate exceptions. Noncompliant quality control (QC) is further explained in narrative comments.

- Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
- Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt
The sample was received on 3/13/2024 8:00 AM. Unless otherwise noted below, the sample arrived in good condition, and, where required, properly preserved and on ice. The temperatures of the 3 coolers at receipt time were 1.4°C, 1.9°C and 2.8°C.

Metals
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry
Method 300.0_28D: The following sample was diluted due to the nature of the sample matrix: 2019-07-F-20240311-01 (240-200984-1). Elevated reporting limits (RLs) are provided.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Gas Flow Proportional Counter
Method 9315_Ra226: Radium 226 prep batch 160-652671

The barium carrier recovery is outside the upper control limit (110%) for the following sample: 2019-07-F-20240311-01 (240-200984-1). There was physical evidence of matrix interference apparent during the initial preparation of the sample. The QC samples associated with the batch have acceptable carrier recovery indicating the presence of matrix interference.

Method 9315_Ra226: Radium-226 prep batch 160-652671:

The following sample has a barium carrier recovery above the 110% QC limit. Affected samples had a barium correction applied, however, there is significant concentrations of salt-like compounds (i.e. calcium, magnesium, sodium, and strontium) that can interfere with a barium sulfate recovery. The LCS (laboratory control sample) has an acceptable spike recovery demonstrating acceptable sample preparation and instrument performance. The samples have been truncated to 100% to reduce any potential bias a high carrier recovery may have. The data have been qualified and reported. 2019-07-F-20240311-01 (240-200984-1)

Method 9320_Ra228: Radium 228 prep batch 160-652672

The barium carrier recovery is outside the upper control limit (110%) for the following sample: 2019-07-F-20240311-01 (240-200984-1). There was physical evidence of matrix interference apparent during the initial preparation of the sample. The QC samples associated with the batch have acceptable carrier recovery indicating the presence of matrix interference.

Method 9320_Ra228: Radium-228 prep batch 160-652672:

The following sample has a barium carrier recovery above the 110% QC limit. Affected samples had a barium correction applied, however, there is significant concentrations of salt-like compounds (i.e. calcium, magnesium, sodium, and strontium) that can interfere with a barium sulfate recovery. The LCS (laboratory control sample) has an acceptable spike recovery demonstrating acceptable sample preparation and instrument performance. The samples have been truncated to 100% to reduce any potential bias a high carrier recovery may have. The data have been qualified and reported. 2019-07-F-20240311-01 (240-200984-1)

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Analysis Requested

Preservation Codes:

A - HCL, B - NaOH, C - Zn Acetate, D - Nitric Acid, E - NaHSO4, F - MeOH, G - Amchlor, H - Ascorbic Acid, I - Ice, J - DI Water, K - EDTA, L - EDA, M - Hexane, N - None, O - AsNaO2, P - Na2O4S, Q - Na2SO3, R - Na2S2O3, S - H2SO4, T - TSP Dodecahydrate, U - Acetone, V - MCAA, W - pH 4-5, Y - Trizma, Z - other (specify)

Other:

Sample Identification - Client ID (Lab ID)	Sample Date	Sample Time	Sample Type (C=Comp, G=grab)	Matrix (W=water, S=solid, O=waste/oil, BT=Tissue, A=Air)	Field Filtered Sample (Yes or No)	Perform MS/MSD (Yes or No)	9320_Ra228/PrecSep_0 Radium-228 (GFPC)	9315_Ra226/PrecSep_21 Radium-226 (GFPC)	Ra226Ra228_GFPC/ Combined Radium-226 and Radium-228	Total Number of containers	Special Instructions/Note:
			Preservation Code:								
2019-07-F-20240311-01 (240-200984-1)	3/11/24	14:52 Eastern		Water			X	X	X	2	, Recount of TAR after 21 day ingrowth if > action limit; save planchet

Note: Since laboratory accreditations are subject to change, Eurofins Environment Testing North Central, LLC places the ownership of method, analyte & accreditation compliance upon our subcontract laboratories. This sample shipment is forwarded under chain-of-custody. If the laboratory does not currently maintain accreditation in the State of Origin listed above for analysis/tests/matrix being analyzed, the samples must be shipped back to the Eurofins Environment Testing North Central, LLC laboratory or other instructions will be provided. Any changes to accreditation status should be brought to Eurofins Environment Testing North Central, LLC attention immediately. If all requested accreditations are current to date, return the signed Chain of Custody attesting to said compliance to Eurofins Environment Testing North Central, LLC.

Possible Hazard Identification	*Sample Disposal (A fee may be assessed if samples are retained longer than 1 month)*
Unconfirmed	☐ *Return To Client* ☐ *Disposal By Lab* ☐ *Archive For* _____ *Months*
Deliverable Requested: I, II, III, IV, Other (specify) Primary Deliverable Rank: 2	Special Instructions/QC Requirements:

Login Sample Receipt Checklist

Client: Lightstone Generation Gavin Power LLC

Job Number: 240-200984-1

Login Number: 200984
List Number: 2
Creator: Pinette, Meadow L

List Source: Eurofins St. Louis
List Creation: 03/14/24 11:26 AM

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	True	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	N/A	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	N/A	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

ANALYTICAL REPORT

PREPARED FOR

Attn: Taylor Huffman
Lightstone Generation Gavin Power LLC
7397 OH-7
Cheshire, Ohio 45620
Generated 4/11/2024 11:13:47 AM

JOB DESCRIPTION

Federal CCR Wells

JOB NUMBER

240-200986-1

Eurofins Cleveland
180 S. Van Buren Avenue
Barberton OH 44203

See page two for job notes and contact information.

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing North Central, LLC Project Manager.

Qualifiers

Metals

Qualifier	Qualifier Description
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
F1	MS and/or MSD recovery exceeds control limits.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Rad

Qualifier	Qualifier Description
U	Result is less than the sample detection limit.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Job ID: 240-200986-1 — Eurofins Cleveland

Job Narrative
240-200986-1

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers are applied to indicate exceptions. Noncompliant quality control (QC) is further explained in narrative comments.

- Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
- Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt
The samples were received on 3/13/2024 8:00 AM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperatures of the 3 coolers at receipt time were 1.4°C, 1.9°C and 2.8°C.

Metals
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Gas Flow Proportional Counter
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Rad
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Method Summary

Client: Lightstone Generation Gavin Power LLC

Note: Since laboratory accreditations are subject to change, Eurofins Environment Testing North Central, LLC places the ownership of method, analyte & accreditation compliance upon our subcontract laboratories. This sample shipment is forwarded under chain-of-custody. If the laboratory does not currently maintain accreditation in the State of Origin listed above for analysis/tests/matrix being analyzed, the samples must be shipped back to the Eurofins Environment Testing North Central, LLC laboratory or other instructions will be provided. Any changes to accreditation status should be brought to Eurofins Environment Testing North Central, LLC attention immediately. If all requested accreditations are current to date, return the signed Chain of Custody attesting to said compliance to Eurofins Environment Testing North Central, LLC.

Possible Hazard Identification	*Sample Disposal (A fee may be assessed if samples are retained longer than 1 month)*

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	True	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	N/A	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	N/A	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

ANALYTICAL REPORT

PREPARED FOR

Attn: Taylor Huffman
Lightstone Generation Gavin Power LLC
7397 OH-7
Cheshire, Ohio 45620
Generated 4/15/2024 4:34:18 PM

JOB DESCRIPTION

Federal CCR Wells

JOB NUMBER

240-201157-1

Eurofins Cleveland
180 S. Van Buren Avenue
Barberton OH 44203

See page two for job notes and contact information.

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing North Central, LLC Project Manager.

Qualifiers

Metals

Qualifier	Qualifier Description
B	Compound was found in the blank and sample.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

General Chemistry

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Rad

Qualifier	Qualifier Description
G	The Sample MDC is greater than the requested RL.
U	Result is less than the sample detection limit.
X	Carrier is outside acceptance limits.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Job ID: 240-201157-1 — Eurofins Cleveland

Job Narrative
240-201157-1

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers are applied to indicate exceptions. Noncompliant quality control (QC) is further explained in narrative comments.

- Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
- Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt
The samples were received on 3/15/2024 8:00 AM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperatures of the 6 coolers at receipt time were 1.0°C, 1.9°C, 3.5°C, 4.3°C, 11.5°C and 21.8°C.

Metals
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry
Method 300.0_28D: The following samples were diluted due to the nature of the sample matrix: 9631-F-20240313-01 (240-201157-6) and DUP-003-F-20240313-01 (240-201157-7). Elevated reporting limits (RLs) are provided.

Method 300.0_28D: The following samples were diluted due to the nature of the sample matrix: 2019-09-F-20240312-01 (240-201157-1), 2022-14-F-20240312-01 (240-201157-2) and 2022-03-F-20240312-01 (240-201157-3). Elevated reporting limits (RLs) are provided.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Gas Flow Proportional Counter
Method 9315_Ra226: Radium 226 Prep Batch 160-653033

The barium carrier recovery is outside the upper control limit (110%) for the following samples: 2022-14-F-20240312-01 (240-201157-2), 9631-F-20240313-01 (240-201157-6) and DUP-003-F-20240313-01 (240-201157-7). The QC samples associated with the batch have acceptable carrier recovery indicating the presence of matrix interference.

Method 9315_Ra226: Radium-226 prep batch 160-653033:

The following sample had Ba carrier recovery above the QC limit: 2022-14-F-20240312-01 (240-201157-2). Native Ba was found in the sample, and this value was used to correct the carrier yield. The recovery is now within QC limits.

Method 9315_Ra226: Radium-226 prep batch 160-653033:

The following sample has a barium carrier recovery above the 110% QC limit. Affected samples had a barium correction applied, however, there is significant concentrations of salt-like compounds (i.e. calcium, magnesium, sodium, and strontium) that can interfere with a barium sulfate recovery. The LCS (laboratory control sample) has an acceptable spike recovery demonstrating acceptable sample preparation and instrument performance. The samples have been truncated to 100% to reduce any potential bias a high carrier recovery may have. The data have been qualified and reported. 9631-F-20240313-01 (240-201157-6) and DUP-003-F-20240313-01 (240-201157-7)

Method 9320_Ra228: Radium 228 Prep Batch 160-653034

The barium carrier recovery is outside the upper control limit (110%) for the following samples: 2022-14-F-20240312-01 (240-201157-2), 9631-F-20240313-01 (240-201157-6) and DUP-003-F-20240313-01 (240-201157-7). The QC samples associated with the batch have acceptable carrier recovery indicating the presence of matrix interference.

Job ID: 240-201157-1 (Continued) Eurofins Cleveland

Method 9320_Ra228: Radium-228 prep batch 160-653034:

The detection goal was not met for the following samples due to the reduced sample volume attributed to the presence of matrix interferences: 2019-09-F-20240312-01 (240-201157-1) and 2003-F-20240313-01 (240-201157-5) . Analytical results are reported with the detection limit achieved.

Method 9320_Ra228: Radium-228 prep batch 160-653034:

The following sample had Ba carrier recovery above the QC limit: 2022-14-F-20240312-01 (240-201157-2). Native Ba was found in the sample, and this value was used to correct the carrier yield. The recovery is now within QC limits.

Method 9320_Ra228: Radium-228 prep batch 160-653034:

The following sample has a barium carrier recovery above the 110% QC limit. Affected samples had a barium correction applied, however, there is significant concentrations of salt-like compounds (i.e. calcium, magnesium, sodium, and strontium) that can interfere with a barium sulfate recovery. The LCS (laboratory control sample) has an acceptable spike recovery demonstrating acceptable sample preparation and instrument performance. The samples have been truncated to 100% to reduce any potential bias a high carrier recovery may have. The data have been qualified and reported. 9631-F-20240313-01 (240-201157-6) and DUP-003-F-20240313-01 (240-201157-7)

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Rad
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Note: Since laboratory accreditations are subject to change, Eurofins Environment Testing North Central, LLC places the ownership of method, analyte & accreditation compliance upon our subcontract laboratories. This sample shipment is forwarded under chain-of-custody. If the laboratory does not currently maintain accreditation in the State of Origin listed above for analysis/tests/matrix being analyzed, the samples must be shipped back to the Eurofins Environment Testing North Central, LLC laboratory or other instructions will be provided. Any changes to accreditation status should be brought to Eurofins Environment Testing North Central, LLC attention immediately. If all requested accreditations are current to date, return the signed Chain of Custody attesting to said compliance to Eurofins Environment Testing North Central, LLC.

Login Sample Receipt Checklist

Client: Lightstone Generation Gavin Power LLC

Job Number: 240-201157-1

Login Number: 201157
List Number: 2
Creator: Pinette, Meadow L

List Source: Eurofins St. Louis
List Creation: 03/18/24 12:25 PM

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	True	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	N/A	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	N/A	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

ANALYTICAL REPORT

PREPARED FOR

Attn: Taylor Huffman
Lightstone Generation Gavin Power LLC
7397 OH-7
Cheshire, Ohio 45620

Generated 4/1/2024 8:27:55 PM

JOB DESCRIPTION

Federal CCR Wells Snap Sampler

JOB NUMBER

240-201158-1

Eurofins Cleveland
180 S. Van Buren Avenue
Barberton OH 44203

See page two for job notes and contact information.

myEOL

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing North Central, LLC Project Manager.

Job ID: 240-201158-1

Qualifiers

Metals

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Job ID: 240-201158-1 — Eurofins Cleveland

Job Narrative
240-201158-1

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers are applied to indicate exceptions. Noncompliant quality control (QC) is further explained in narrative comments.

- Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
- Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt
The samples were received on 3/15/2024 8:00 AM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperatures of the 6 coolers at receipt time were 1.0°C, 1.9°C, 3.5°C, 4.3°C, 11.5°C and 21.8°C.

Metals
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Method Summary

Client: Lightstone Generation Gavin Power LLC
Project/Site: Federal CCR Wells Snap Sampler

Job ID: 240-201158-1

Method	Method Description	Protocol	Laboratory
6010D	Metals (ICP)	SW846	EET CLE
6020B	Metals (ICP/MS)	SW846	EET CLE
300.0	Anions, Ion Chromatography	EPA	EET CLE
SM 2540C	Solids, Total Dissolved (TDS)	SM	EET CLE
3005A	Preparation, Total Recoverable or Dissolved Metals	SW846	EET CLE

ANALYTICAL REPORT

PREPARED FOR

Attn: Taylor Huffman
Lightstone Generation Gavin Power LLC
7397 OH-7
Cheshire, Ohio 45620
Generated 4/15/2024 4:34:57 PM

JOB DESCRIPTION

Federal CCR Wells

JOB NUMBER

240-201241-1

Eurofins Cleveland
180 S. Van Buren Avenue
Barberton OH 44203

See page two for job notes and contact information.

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing North Central, LLC Project Manager.

Qualifiers

Metals

Qualifier	Qualifier Description
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

General Chemistry

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Rad

Qualifier	Qualifier Description
U	Result is less than the sample detection limit.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Job ID: 240-201241-1 — Eurofins Cleveland

Job Narrative
240-201241-1

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers are applied to indicate exceptions. Noncompliant quality control (QC) is further explained in narrative comments.

- Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
- Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt
The samples were received on 3/15/2024 2:15 PM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperatures of the 3 coolers at receipt time were 0.8°C, 1.5°C and 4.2°C.

Metals
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry
Method 300.0_28D: The following sample was diluted due to the nature of the sample matrix: 9801-F-20240314-01 (240-201241-2). Elevated reporting limits (RLs) are provided.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Gas Flow Proportional Counter
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Rad
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

1 Cooler temperature upon receipt ☑ See Multiple Cooler Form

IR GUN # 17 (CF +0.0 °C) Observed Cooler Temp °C Corrected Cooler Temp °C

2. Were tamper/custody seals on the outside of the cooler(s)? If Yes Quantity	Yes (No)	
-Were the seals on the outside of the cooler(s) signed & dated?	Yes No (NA)	
-Were tamper/custody seals on the bottle(s) or bottle kits (LLHg/MeHg)?	Yes (No)	
-Were tamper/custody seals intact and uncompromised?	Yes No (NA)	
3 Shippers' packing slip attached to the cooler(s)?	Yes (No)	
4. Did custody papers accompany the sample(s)?	(Yes) No	
5 Were the custody papers relinquished & signed in the appropriate place?	(Yes) No	
6. Was/were the person(s) who collected the samples clearly identified on the COC?	(Yes) No	
7 Did all bottles arrive in good condition (Unbroken)?	(Yes) No	
8 Could all bottle labels (ID/Date/Time) be reconciled with the COC?	Yes No	
9 For each sample, does the COC specify preservatives (Y)N), # of containers (Y)N), and sample type of grab/comp(Y)N)?		
10 Were correct bottle(s) used for the test(s) indicated?	(Yes) No	
11 Sufficient quantity received to perform indicated analyses?	(Yes) No	
12 Are these work share samples and all listed on the COC?	Yes (No)	
If yes, Questions 13-17 have been checked at the originating laboratory		
13 Were all preserved sample(s) at the correct pH upon receipt?	Yes No NA	pH Strip Lot# ~~HC316719~~ HC329089
14. Were VOAs on the COC?	Yes (No)	
15 Were air bubbles >6 mm in any VOA vials? ● ← Larger than this	Yes No (NA)	
16 Was a VOA trip blank present in the cooler(s)? Trip Blank Lot #	Yes (No)	
17 Was a LL Hg or Me Hg trip blank present?	Yes (No)	

Tests that are not checked for pH by Receiving:
VOAs

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	True	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	N/A	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	N/A	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing North Central, LLC Project Manager.

Qualifiers

Metals

Qualifier	Qualifier Description
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

General Chemistry

Qualifier	Qualifier Description
B	Compound was found in the blank and sample.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Rad

Qualifier	Qualifier Description
G	The Sample MDC is greater than the requested RL.
U	Result is less than the sample detection limit.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Job ID: 240-201413-1 — Eurofins Cleveland

Job Narrative
240-201413-1

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers are applied to indicate exceptions. Noncompliant quality control (QC) is further explained in narrative comments.

- Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
- Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt
The samples were received on 3/20/2024 8:00 AM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperatures of the 3 coolers at receipt time were 2.2°C, 3.4°C and 3.8°C.

Metals
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Gas Flow Proportional Counter
Method 9320_Ra228: Radium-228 batch 653870
The LCS recovered at (136%). The limits in our LIMS system at 75-125 reflect the requirements of a regulatory agency that represents a large amount of our work. However the samples associated with this LCS are not from this agency and are therefore held to our in-house statistical limits of (69-145%) per method requirements. The LCS passes, no further action is required

(LCS 160-653870/2-A)

Method 9320_Ra228: Radium-228 batch 653870
The detection goal was not met for the following sample due to the reduced sample volume attributed to the presence of matrix interferences: 94139-F-20240318-01 (240-201413-8). Analytical results are reported with the detection limit achieved.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Rad
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

2. Were tamper/custody seals on the outside of the cooler(s)? If Yes Quantity 1 each	Yes	No
-Were the seals on the outside of the cooler(s) signed & dated?	Yes	No NA
-Were tamper/custody seals on the bottle(s) or bottle kits (LLHg/MeHg)?	Yes	No
-Were tamper/custody seals intact and uncompromised?	Yes	No NA
3 Shippers' packing slip attached to the cooler(s)?	Yes	No
4. Did custody papers accompany the sample(s)?	Yes	No
5 Were the custody papers relinquished & signed in the appropriate place?	Yes	No
6 Was/were the person(s) who collected the samples clearly identified on the COC?	Yes	No
7 Did all bottles arrive in good condition (Unbroken)?	Yes	No
8 Could all bottle labels (ID/Date/Time) be reconciled with the COC?	Yes	No
9 For each sample, does the COC specify preservatives (Y/N), # of containers (Y/N), and sample type of grab/comp (Y/N)?		
10 Were correct bottle(s) used for the test(s) indicated?	Yes	No
11 Sufficient quantity received to perform indicated analyses?	Yes	No
12. Are these work share samples and all listed on the COC?	Yes	No
If yes, Questions 13 17 have been checked at the originating laboratory		
13 Were all preserved sample(s) at the correct pH upon receipt?	Yes	No NA pH Strip Lot# HC316719
14. Were VOAs on the COC?	Yes	No
15 Were air bubbles >6 mm in any VOA vials? ● ← Larger than this.	Yes	No NA
16 Was a VOA trip blank present in the cooler(s)? Trip Blank Lot # _____	Yes	No
17 Was a LL Hg or Me Hg trip blank present? _____	Yes	No

Tests that are not checked for pH by Receiving:
VOAs
Oil and Grease

Note: Since laboratory accreditations are subject to change, Eurofins Environment Testing North Central, LLC places the ownership of method, analyte & accreditation compliance upon our subcontract laboratories. This sample shipment is forwarded under chain-of-custody. If the laboratory does not currently maintain accreditation in the State of Origin listed above for analysis/tests/matrix being analyzed, the samples must be shipped back to the Eurofins Environment Testing North Central, LLC laboratory or other instructions will be provided. Any changes to accreditation status should be brought to Eurofins Environment Testing North Central, LLC attention immediately. If all requested accreditations are current to date, return the signed Chain of Custody attesting to said compliance to Eurofins Environment Testing North Central, LLC.

There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	N/A	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

ANALYTICAL REPORT

PREPARED FOR

Attn: Taylor Huffman
Lightstone Generation Gavin Power LLC
7397 OH-7
Cheshire, Ohio 45620
Generated 4/26/2024 10:28:49 AM

JOB DESCRIPTION

Federal CCR Wells

JOB NUMBER

240-201697-1

Eurofins Cleveland
180 S. Van Buren Avenue
Barberton OH 44203

See page two for job notes and contact information.

myEOL

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing North Central, LLC Project Manager.

Authorization

Job ID: 240-201697-1

Qualifiers

Metals

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Rad

Qualifier	Qualifier Description
U	Result is less than the sample detection limit.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Job ID: 240-201697-1 — Eurofins Cleveland

Job Narrative
240-201697-1

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers are applied to indicate exceptions. Noncompliant quality control (QC) is further explained in narrative comments.

- Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
- Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt
The sample was received on 3/25/2024 3:30 PM. Unless otherwise noted below, the sample arrived in good condition, and, where required, properly preserved and on ice. The temperatures of the 4 coolers at receipt time were 1.5°C, 2.2°C, 3.2°C and 3.3°C.

Metals
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Gas Flow Proportional Counter
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Rad
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Method Summary

Client: Lightstone Generation Gavin Power LLC

Note: Since laboratory accreditations are subject to change, Eurofins Environment Testing North Central, LLC places the ownership of method, analyte & accreditation compliance upon our subcontract laboratories. This sample shipment is forwarded under chain-of-custody. If the laboratory does not currently maintain accreditation in the State of Origin listed above for analysis/tests/matrix being analyzed, the samples must be shipped back to the Eurofins Environment Testing North Central, LLC laboratory or other instructions will be provided. Any changes to accreditation status should be brought to Eurofins Environment Testing North Central, LLC attention immediately. If all requested accreditations are current to date, return the signed Chain of Custody attesting to said compliance to Eurofins Environment Testing North Central, LLC.

Possible Hazard Identification	Sample Disposal (A fee may be assessed if samples are retained longer than 1 month)
Unconfirmed	☐ Return To Client ☐ Disposal By Lab ☐ Archive For _____ Months

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	True	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	N/A	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	N/A	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing North Central, LLC Project Manager.

Qualifiers

Metals

Qualifier	Qualifier Description
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
F2	MS/MSD RPD exceeds control limits

General Chemistry

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Job ID: 240-202722-1 Eurofins Cleveland

Job Narrative
240-202722-1

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers are applied to indicate exceptions. Noncompliant quality control (QC) is further explained in narrative comments.

- Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
- Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt
The samples were received on 4/12/2024 8:00 AM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperatures of the 2 coolers at receipt time were 1.2°C and 4.4°C.

Metals
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry
Method 300.0_28D: The following samples were diluted due to the nature of the sample matrix: 9631-F-A3-20240410-01 (240-202722-1) and DUP-001-F-A3-20240410-01 (240-202722-2). Elevated reporting limits (RLs) are provided.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Qualifiers

Metals

Qualifier	Qualifier Description
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
F1	MS and/or MSD recovery exceeds control limits.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

General Chemistry

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Rad

Qualifier	Qualifier Description
F1	MS and/or MSD recovery exceeds control limits.
U	Result is less than the sample detection limit.
X	Carrier is outside acceptance limits.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Job ID: 240-202726-1 Eurofins Cleveland

Job Narrative
240-202726-1

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers are applied to indicate exceptions. Noncompliant quality control (QC) is further explained in narrative comments.

- Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
- Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt
The samples were received on 4/12/2024 8:00 AM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperatures of the 2 coolers at receipt time were 1.2°C and 4.4°C.

Metals
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry
Method 300.0_28D: The following samples were diluted due to the nature of the sample matrix: 9631-F-A4-20240410-01 (240-202726-1) and DUP-001-F-A4-20240410-01 (240-202726-2). Elevated reporting limits (RLs) are provided.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Gas Flow Proportional Counter
Method 9315_Ra226: Radium 226 prep batch 160-657072

The barium carrier recovery is outside the upper control limit (110%) for the following samples: 9631-F-A4-20240410-01 (240-202726-1), 9631-F-A4-20240410-01 (240-202726-1[MS]), 9631-F-A4-20240410-01 (240-202726-1[MSD]) and DUP-001-F-A4-20240410-01 (240-202726-2). The QC samples associated with the batch have acceptable carrier recovery indicating the presence of matrix interference.

Method 9315_Ra226: Radium-226 prep batch 160-657072:

Due to the high concentration of Ra-226, the matrix spike / matrix spike duplicate (MS/MSD) for preparation batch 160-657072 and analytical batch 160-661646 could not be evaluated for accuracy and precision. The associated laboratory control sample (LCS) met acceptance criteria. 9631-F-A4-20240410-01 (240-202726-1[MS]) and 9631-F-A4-20240410-01 (240-202726-1[MSD])

Method 9315_Ra226: Radium-226 prep batch 160-657072:

The following samples have been truncated to 100% to reduce any potential bias a high carrier recovery may have. Samples with significant salt-like compounds had a native correction applied. The high concentrations of salt-like compounds can interfere with the barium sulfate recovery. The LCS (laboratory control sample) has an acceptable spike recovery demonstrating acceptable sample preparation and instrument performance.The data have been qualified and reported. 9631-F-A4-20240410-01 (240-202726-1), 9631-F-A4-20240410-01 (240-202726-1[MS]), 9631-F-A4-20240410-01 (240-202726-1[MSD]) and DUP-001-F-A4-20240410-01 (240-202726-2)

Method 9320_Ra228: Radium 228 prep batch 160-657073

The barium carrier recovery is outside the upper control limit (110%) for the following samples: 9631-F-A4-20240410-01 (240-202726-1), 9631-F-A4-20240410-01 (240-202726-1[MS]), 9631-F-A4-20240410-01 (240-202726-1[MSD]) and DUP-001-F-A4-20240410-01 (240-202726-2). The QC samples associated with the batch have acceptable carrier recovery indicating the presence of matrix interference.

Method 9320_Ra228: Radium-228 prep batch 160-657073:

Job ID: 240-202726-1 (Continued) Eurofins Cleveland

Due to the high concentration of Ra-228, the matrix spike / matrix spike duplicate (MS/MSD) for preparation batch 160-657073 and analytical batch 160-660949 could not be evaluated for accuracy and precision. The associated laboratory control sample (LCS) met acceptance criteria. 9631-F-A4-20240410-01 (240-202726-1[MS]) and 9631-F-A4-20240410-01 (240-202726-1[MSD])

Method 9320_Ra228: Radium-228 prep batch 160-657073:

The following samples have been truncated to 100% to reduce any potential bias a high carrier recovery may have. Samples with significant salt-like compounds had a native correction applied. The high concentrations of salt-like compounds can interfere with the barium sulfate recovery. The LCS (laboratory control sample) has an acceptable spike recovery demonstrating acceptable sample preparation and instrument performance.The data have been qualified and reported. 9631-F-A4-20240410-01 (240-202726-1), 9631-F-A4-20240410-01 (240-202726-1[MS]), 9631-F-A4-20240410-01 (240-202726-1[MSD]) and DUP-001-F-A4-20240410-01 (240-202726-2)

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Rad
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

	-Were tamper/custody seals intact and uncompromised?	(Yes) No NA
3	Shippers' packing slip attached to the cooler(s)?	Yes (No)
4	Did custody papers accompany the sample(s)?	(Yes) No
5	Were the custody papers relinquished & signed in the appropriate place?	(Yes) No
6	Was/were the person(s) who collected the samples clearly identified on the COC?	(Yes) No
7	Did all bottles arrive in good condition (Unbroken)?	(Yes) No
8	Could all bottle labels (ID/Date/Time) be reconciled with the COC?	(Yes) No
9	For each sample, does the COC specify preservatives (Y/N) # of containers (Y/N), and sample type of grab/comp (Y/N)?	
10	Were correct bottle(s) used for the test(s) indicated?	(Yes) No
11	Sufficient quantity received to perform indicated analyses?	(Yes) No
12	Are these work share samples and all listed on the COC?	Yes (No)
	If yes, Questions 13 17 have been checked at the originating laboratory	
13	Were all preserved sample(s) at the correct pH upon receipt?	(Yes) No NA pH Strip Lot# HC329089
14	Were VOAs on the COC?	Yes (No)
15	Were air bubbles >6 mm in any VOA vials? ● ← Larger than this.	Yes No (NA)
16	Was a VOA trip blank present in the cooler(s)? Trip Blank Lot #_____	Yes (No)
17	Was a LL Hg or Me Hg trip blank present? _____	Yes (No)

Note: Since laboratory accreditations are subject to change, Eurofins Environment Testing North Central, LLC places the ownership of method, analyte & accreditation compliance upon our subcontract laboratories. This sample shipment is forwarded under chain-of-custody. If the laboratory does not currently maintain accreditation in the State of Origin listed above for analysis/tests/matrix being analyzed, the samples must be shipped back to the Eurofins Environment Testing North Central, LLC laboratory or other instructions will be provided. Any changes to accreditation status should be brought to Eurofins Environment Testing North Central, LLC attention immediately. If all requested accreditations are current to date, return the signed Chain of Custody attesting to said compliance to Eurofins Environment Testing North Central, LLC.

Possible Hazard Identification	*Sample Disposal (A fee may be assessed if samples are retained longer than 1 month)*

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	True	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	N/A	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	N/A	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	N/A	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing North Central, LLC Project Manager.

Qualifiers

Metals

Qualifier	Qualifier Description
^+	Continuing Calibration Verification (CCV) is outside acceptance limits, high biased.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Rad

Qualifier	Qualifier Description
U	Result is less than the sample detection limit.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Job ID: 240-202901-1 Eurofins Cleveland

Job Narrative
240-202901-1

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers are applied to indicate exceptions. Noncompliant quality control (QC) is further explained in narrative comments.

- Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
- Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt
The samples were received on 4/17/2024 8:00 AM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperatures of the 4 coolers at receipt time were 1.7°C, 3.0°C, 3.4°C and 12.7°C.

Metals
Method 6020B - Total Recoverable: The continuing calibration verification (CCV) associated with batch 240-610163 recovered above the upper control limit for beryllium. The samples associated with this CCV were less than the reporting limit for the affected analyte; therefore, the data have been reported. The associated samples are impacted: 2022-05-F-A4-20240411-01 (240-202901-1), 2022-04-F-A4-20240411-01 (240-202901-2), 2022-03-F-A4-20240412-01 (240-202901-3), 2022-14-F-A4-20240412-01 (240-202901-4), 2022-06-F-A4-20240412-01 (240-202901-5), 2022-13-F-A4-20240415-01 (240-202901-7) and (240-202890-D-1-A).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry
Method 300.0_28D: The following samples were diluted due to the nature of the sample matrix: 2022-03-F-A4-20240412-01 (240-202901-3) and 2022-14-F-A4-20240412-01 (240-202901-4). Elevated reporting limits (RLs) are provided.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Gas Flow Proportional Counter
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Rad
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.
